Seismic Provisions for Structural Steel Buildings

PUBLIC REVIEW DRAFT dated March 16, 2015
# SYMBOLS

The symbols listed below are to be used in addition to or replacements for those in the AISC Specification for Structural Steel Buildings. Where there is a duplication of the use of a symbol between the Provisions and the AISC Specification for Structural Steel Buildings, the symbol listed herein takes precedence. The section or table number in the right-hand column refers to where the symbol is first used.

SYMBOLS-ii

46  $E$  Seismic load effect, kips (N) ........................................... F1.4a  
47  $E$  Modulus of elasticity of steel = 29,000 ksi  
48  
49  $E_{el}$  Capacity-limited horizontal seismic load effect ................. B2  
50  $E_{mh}$  Horizontal seismic load effect, including the overstrength  
factor, kips (N) or kip-in. (N-mm) ........................................ B2  
52  $F_{cr}$  Critical stress, ksi (MPa) ................................................. F1.6a  
53  $F_{cre}$  Critical stress calculated from Specification Chapter E using  
expected yield stress, ksi (MPa) ........................................... F1.6a  
55  $F_{y}$  Specified minimum yield stress, ksi (MPa).  As used in the  
Specification, "yield stress" denotes either the minimum  
specified yield point (for those steels that have a yield point) or  
the specified yield strength (for those steels that do not have a  
yield point). ................................................................. A3.2  
59  $F_{yb}$  Specified minimum yield stress of a beam, ksi (MPa) .... E3.4a  
60  $F_{yc}$  Specified minimum yield stress of a column, ksi (MPa) E3.4a  
62  $F_{ysc}$  Specified minimum yield stress of the steel core, or actual yield  
stress of the steel core as determined from a coupon test, ksi  
(MPa) ............................................................................. F4.5b  
65  $F_{ysr}$  Specified minimum yield stress of the ties, ksi (MPa). .... D1.4b  
66  $F_{ysr}$  Specified minimum yield stress of transverse reinforcement, ksi  
(MPa) .............................................................................. H4.5b  
68  $F_{ysr}$  Specified minimum yield stress of transfer reinforcement, ksi  
(MPa) ............................................................................... H5.5c  
70  $F_{yw}$  Specified minimum yield stress of web skin plates,  
ksi (MPa) ............................................................................ H7.5b  
71  $F_{u}$  Specified minimum tensile strength, ksi (MPa) ........ A3.2  
73  $H$  Height of story, in. (mm) ............................................... D2.5c  
74  $H_c$  Clear height of the column between beam connections,  
including a structural slab, if present, in. (mm) ................. F2.6d  
76  $I$  Moment of inertia, in.4 (mm^4) ............................................. E4.5b  
77  $I_b$  Moment of inertia of a horizontal boundary element taken  
perpendicular to the direction of the web plate line, in.4 (mm^4)  
...................................................................................... F5.4a  
80  $I_c$  Moment of inertia of a vertical boundary element taken  
perpendicular to the direction of the web plate line, in.4 (mm^4) 
...................................................................................... F5.4a  
83  $I_y$  Moment of inertia about an axis in the plane of the EBF in.4  
(mm^4) ............................................................................. F3.5b  
85  $I_y$  Moment of inertia of the plate, in.4 (mm^4) ..................... F5.7b  
86  $K$  Effective length factor .................................................... F1.5b  
87  $L$  Live load due to occupancy and moveable equipment, kips (N)  
...................................................................................... D1.4b  
89  $L$  Length of column, in. (mm) ............................................ E3.4c  
90  $L$  Length of truss span, in. (mm) ........................................ E4.5b  
91  $L$  Length of brace, in. (mm) ............................................. F1.5b  
92  $L$  Distance between vertical boundary element centerlines, in.
SYMBOLS-iii

93 \( L_b \) Length between points which are either braced against lateral
94 displacement of compression flange or braced against twist of
95 the cross section, in. (mm) .............................................. D1.2a
96 \( L_{cf} \) Clear length of beam, in. (mm) ................................ E1.6b
97 \( L_{cf} \) Clear distance between column flanges, in. (mm) .......... F5.5b
98 \( L_e \) Embedment length of coupling beam, in. (mm) .......... H4.5b
99 \( L_h \) Distance between plastic hinge locations, as defined within the
100 test report or ANSI/AISC 358, in. (mm) ......................... E2.6d
101 \( L_s \) Length of the special segment, in. (mm) .................. E4.5b
102 \( M_{a} \) Required flexural strength, using ASD load combinations, kip-
103 in. (N-mm) .......................................................... D1.2c
104 \( M_{bc} \) Nominal flexural strength of the chord member of the special
105 segment, kip-in. (N-mm) ............................................. E4.5b
106 \( M_{n,PR} \) Nominal flexural strength of PR connection at a rotation of 0.02
107 rad, kip-in. (N-mm) ....................................................... E1.6c
108 \( M_p \) Plastic flexural strength, kip-in. (N-mm) .................. E1.6b
109 \( M_p \) Plastic flexural strength of a link, kip-in. (N-mm) ........ F3.4a
110 \( M_p \) Plastic flexural strength of the steel, concrete-encased or
111 composite beam, kip-in. (N-mm) ................................ G2.6b
112 \( M_p \) Moment corresponding to plastic stress distribution over the
113 composite cross section, kip-in. (N-mm) ......................... G4.6c
114 \( M_{pc} \) Plastic flexural strength of the column, kip-in. (N-mm) . D2.5c
115 \( M_{pcc} \) Plastic flexural strength of a composite column, kip-in. (N-mm)
116 .......................................................... G2.6f
117 \( M_{p,exp} \) Expected flexural strength, kip-in. (N-mm) .......... D1.2c
118 \( M_{pr} \) Probable maximum moment at the location of the plastic hinge,
119 as determined in accordance with ANSI/AISC 358, or as
120 otherwise determined in a connection prequalification in
121 accordance with Section K1, or in a program of qualification
122 testing in accordance with Section K2, kip-in. (N-mm) .. E3.4a
123 \( M_r \) Required flexural strength, kip-in. (N-mm) .............. D1.2a
124 \( M_u \) Required flexural strength, using LRFD load combinations, kip-
125 in. (N-mm) .......................................................... D1.2c
126 \( M_v \) Additional moment due to shear amplification from the location
127 of the plastic hinge to the column centerline, kip-in. (N-mm) ..
128 ............................................................................. E3.4a
129 \( M_{uv} \) Moment due to shear amplification from the location of the
130 plastic hinge to the column centerline, kip-in. (N-mm) ... G3.4a
131 \( M_{pb} \) Moment at the intersection of the beam and column centerlines
132 determined by projecting the beam maximum developed
133 moments from the column face, kip-in. (N-mm) .......... E3.4a
134 \( M_{pc} \) The flexural strengths of the columns above and below the joint,
135 reduced for axial loads, projected to the beam centerline, kip-in.
136 (N-mm) .......................................................... E3.4a
SYMBOLS-iv

$M^*_{pcc}$ Moment in the column above or below the joint at the intersection of the beam and column centerlines, kip-in. (N-mm) ............................................. G3.4a

$M^*_{p,exp}$ Moment in the steel beam or concrete-encased composite beam at the intersection of the beam and column centerlines, kip-in. (N-mm) ............................................. G3.4a

$N_{MV}$ Notional load factor for design of multi-tiered buckling-restrained braced frames to account for material variability ..... F4.4c

$N_r$ Number of horizontal rows of perforations ................. F5.7a

$P_a$ Required axial strength using ASD load combinations, kips (N) Table D1.1

$P_{ac}$ Required compressive strength using ASD load combinations, kips (N) ................................................................. E3.4a

$P_b$ Axial design strength of wall at balanced condition, kips (N) ................................................................. H5.4

$P_c$ Available axial strength, kips (N) ................................................................. E3.4a

$P_n$ Nominal axial compressive strength, kips (N) ................................................................. E4.5a

$P_{nc}$ Nominal axial compressive strength of the chord member at the ends, kips (N) ................................................................. E4.4c

$P_{nt}$ Nominal axial tensile strength of diagonal members of the special segment, kips (N) ................................................................. E4.5b

$P_r$ Required axial compressive strength, kips (N) ............... E4.4d

$P_{u}$ Required axial strength using LRFD load combinations, kips (N) ............................................. Table D1.1

$P_{uc}$ Required compressive strength using LRFD load combinations, kips (N) ................................................................. E3.4a

$P_y$ Axial yield strength, kips (N) ................................................................. Table D1.1

$P_{ysc}$ Axial yield strength of steel core, kips (N) ............... E4.2a

$P_{ysc-max}$ Maximum specified axial yield strength of steel core, ksi (MPa) ................................................................. E4.4c

$P_{ysc-min}$ Minimum specified axial yield strength of steel core, ksi (MPa) ................................................................. E4.4c

$R$ Seismic response modification coefficient ....................... A1

$R$ Radius of the cut-out, in. (mm) ................................................................. F5.7b

$R_c$ Factor to account for expected strength of concrete = 1.5 .. H5.5d

$R_n$ Nominal strength, kips (N) ................................................................. A3.2

$R_t$ Ratio of the expected tensile strength to the specified minimum tensile strength $F_u$ ................................................................. A3.2

$R_y$ Ratio of the expected yield stress to the specified minimum yield stress, $F_y$ ................................................................. A3.2

$R_{yb}$ Ratio of the expected yield stress of the beam material to the specified minimum yield stress ................................................. E3.6f

$R_{yc}$ Ratio of the expected yield stress of the column material to the specified minimum yield stress ................................................. E3.6f

$R_{yr}$ Ratio of the expected yield stress of the transverse reinforcement material to the specified minimum yield...
Symbols

- \( S_{\text{diag}} \): Shortest center-to-center distance between holes, in. (mm)
- \( V_a \): Required shear strength using ASD load combinations, kips (N)
- \( V_{\text{comp}} \): Limiting expected shear strength of an encased composite coupling beam, kips (N)
- \( V_n \): Nominal shear strength of link, kips (N)
- \( V_{\text{ne}} \): Expected vertical shear strength of the special segment, kips (N)
- \( V_p \): Plastic shear strength of a link, kips (N)
- \( V_r \): Required shear strength using LRFD or ASD load combinations, kips (N)
- \( V_u \): Required shear strength using LRFD load combinations, kips (N)
- \( V_y \): Nominal shear yield strength, kips (N)
- \( Y_{\text{con}} \): Distance from the top of the steel beam to the top of concrete slab or encasement, in. (mm)
- \( Y_{\text{PNA}} \): Maximum distance from the maximum concrete compression fiber to the plastic neutral axis, in. (mm)
- \( Z \): Plastic section modulus about the axis of bending, in.\(^3\) (mm\(^3\))
- \( Z_c \): Plastic section modulus of the column about the axis of bending, in.\(^3\) (mm\(^3\))
- \( Z_x \): Plastic section modulus about x-axis, in.\(^3\) (mm\(^3\))
- \( Z_{\text{RBS}} \): Minimum plastic section modulus at the reduced beam section, in.\(^3\) (mm\(^3\))
- \( a \): Distance between connectors, in. (mm)
- \( b \): Inside width of a box section, in. (mm)
- \( b_{\text{bf}} \): Width of beam flange, in. (mm)
- \( b_{\text{cf}} \): Width of column flange, in. (mm)
- \( b_f \): Width of flange, in. (mm)
- \( b_w \): Thickness of wall pier, in. (mm)
- \( b_w \): Width of wall, in. (mm)
- \( b_{\text{wc}} \): Width of concrete encasement, in. (mm)
- \( d \): Overall depth of beam, in. (mm)
- \( d \): Nominal bolt diameter, in. (mm)
- \( d \): Overall depth of link, in. (mm)
- \( d_e \): Effective depth of concrete encasement, in. (mm)
- \( d_z \): \( d - 2t_f \) of the deeper beam at the connection, in. (mm)
Length of EBF link, in. (mm) .......................................... F3.5b
Specified compressive strength of concrete, ksi (MPa) ..D1.4b
Clear span of coupling beam, in. (mm) .........................H4.5b
Clear distance between flanges less the fillet or corner radius for
rolled shapes; and for built-up sections, the distance between
adjacent lines of fasteners or the clear distance between flanges
when welds are used; for tees, the overall depth; and for
rectangular HSS, the clear distance between the flanges less the
inside corner radius on each side, in. (mm) ..............Table D1.1
Distance between horizontal boundary element centerlines, in.
(mm) ..............................................................................F5.4a
Overall depth of the boundary member in the plane of the wall,
in. (mm) ...........................................................................H5.5b
Cross-sectional dimension of the confined core region in
composite columns measured center-to-center of the transverse
reinforcement, in. (mm) ......................................................D1.4b
Distance between flange centroids, in. (mm) .............. D1.2c
Governing radius of gyration, in. (mm) ..................... E3.4c
Minimum radius of gyration of individual component, in. (mm)
..................................................................................... E2.5b
Radius of gyration about y-axis, in. (mm) .................. D1.2a
Radius of gyration of individual components about their weak
axis, in. (mm)................................................................. E4.5d
Spacing of transverse reinforcement, in. (mm) .......... D1.4b
Thickness of element, in. (mm) .................................Table D1.1
Thickness of column web or doubler plate, in. (mm) .... E3.6e
Thickness of beam flange, in. (mm) ......................... E3.4c
Minimum required thickness of column flange when no
continuity plates are provided, in. (mm) ......................... E3.6f
Effective web-plate thickness, in. (mm) ...................... F5.7a
Thickness of flange, in. (mm) ........................................ D2.5b
Thickness of steel web plate, in. (mm) ......................... H7.4e
Thickness of web, in. (mm) ........................................... F3.5b
Web-plate thickness, in. (mm) ...................................... F5.7a
Thickness of wall, in. (mm) ............................................. H7.4e
Minimum of \( w_1 \) and \( w_2 \), in. (mm) ......................... H7.4e
Maximum spacing of tie bars in vertical and horizontal
directions, in. (mm) ....................................................... H7.4a
Maximum spacing of tie bars or shear studs in vertical and
horizontal directions, in. (mm) ............................... H7.4b
Vertical and horizontal spacing of tie bars, respectively,
in. (mm)................................................................. H7.4e
Width of panel zone between column flanges, in. (mm) ...E3.6e
Design story drift, in. (mm) ........................................... F3.4a
Deformation quantity used to control loading of test specimen
(totals brace end rotation for the subassemblage test specimen;
277 total brace axial deformation for the brace test specimen), in.  
278 \( \Delta_{bm} \) Value of deformation quantity, \( \Delta_b \), corresponding to the design  
279 story drift, in. (mm) .................................................. K3.4c  
280 \( \Delta_{by} \) Value of deformation quantity, \( \Delta_b \), at first yield of test specimen,  
281 in. (mm) ................................................................. K3.4c  
282 \( \Omega \) Safety factor ..................................................... B3.2  
283 \( \Omega_c \) Safety factor for compression......................... Table D1.1  
284 \( \Omega_o \) System overstrength factor ............................ B2  
285 \( \Omega_v \) Safety factor for shear strength of panel zone of beam-to-column  
286 connections .............................................................. E3.6e  
287 \( \alpha_s \) LRFD-ASD force level adjustment factor = 1.0 for LRFD and  
288 1.5 for ASD .................................................. D1.2a  
289 \( \alpha \) Angle of diagonal members with the horizontal, degrees. E4.5b  
290 \( \alpha \) Angle of web yielding, as measured relative to the vertical,  
291 degrees ................................................................. F5.5b  
292 \( \alpha \) Angle of the shortest center-to-center lines in the opening array  
293 to vertical, degrees.................................................. F5.7a  
294 \( \beta \) Compression strength adjustment factor ................. F4.2a  
295 \( \beta_1 \) Factor relating depth of equivalent rectangular compressive  
296 stress block to neutral axis depth, as defined in ACI 318 H4.5b  
297 \( \gamma_{total} \) Total link rotation angle ................................ K2.4c  
298 \( \theta \) Story drift angle, rad........................................... K2.4b  
299 \( \lambda_{hd}, \lambda_{md} \) Limiting slenderness parameter for highly and moderately  
300 ductile compression elements, respectively ............... D1.1b  
301 \( \phi \) Resistance factor ................................................. B3.2  
302 \( \phi_c \) Resistance factor for compression ..................... Table D1.1  
303 \( \phi_v \) Resistance factor for shear ................................ E3.6e  
304 \( \bar{\rho} \) Strength adjusted reinforcement ratio ................ H7.5b  
305 \( \omega \) Strain hardening adjustment factor ....................... F4.2a
Glossary

The terms listed below are to be used in addition to those in the AISC Specification for Structural Steel Buildings. Some commonly used terms are repeated here for convenience.

Notes:
1. Terms designated with † are common AISI-AISC terms that are coordinated between the two standards developers.
2. Terms designated with * are usually qualified by the type of load effect, for example, nominal tensile strength, available compressive strength, design flexural strength.

Adjusted brace strength. Strength of a brace in a buckling-restrained braced frame at deformations corresponding to 2.0 times the design story drift.

Adjusted link shear strength. Link shear strength including the material overstrength and strain hardening.

Allowable strength\(^*\). Nominal strength divided by the safety factor, \(R_n/\Omega\).

Applicable building code\(^*\). Building code under which the structure is designed.

ASD (allowable strength design)\(^*\). Method of proportioning structural components such that the allowable strength equals or exceeds the required strength of the component under the action of the ASD load combinations.

ASD load combination\(^*\). Load combination in the applicable building code intended for allowable strength design (allowable stress design).

Authority having jurisdiction (AHJ). Organization, political subdivision, office or individual charged with the responsibility of administering and enforcing the provisions of this Standard.

Available strength\(^*\). Design strength or allowable strength, as applicable.

Boundary member. Portion along wall or diaphragm edge strengthened with structural steel sections and/or longitudinal steel reinforcement and transverse reinforcement.

Brace test specimen. A single buckling-restrained brace element used for laboratory testing intended to model the brace in the prototype.

Braced frame\(^*\). An essentially vertical truss system that provides resistance to lateral forces and provides stability for the structural system.

Buckling-restrained brace. A pre-fabricated, or manufactured, brace element consisting of a steel core and a buckling-restraining system as described in Section F4 and qualified by testing as required in Section K3.
Buckling-restrained braced frame (BRBF). A diagonally braced frame employing buckling-restrained braces and meeting the requirements of Section F4.

Buckling-restraining system. System of restraints that limits buckling of the steel core in BRBF. This system includes the casing surrounding the steel core and structural elements adjoining its connections. The buckling-restraining system is intended to permit the transverse expansion and longitudinal contraction of the steel core for deformations corresponding to 2.0 times the design story drift.

Casing. Element that resists forces transverse to the axis of the diagonal brace thereby restraining buckling of the core. The casing requires a means of delivering this force to the remainder of the buckling-restraining system. The casing resists little or no force along the axis of the diagonal brace.

Capacity-limited seismic load. The capacity-limited horizontal seismic load effect, $E_{cl}$, determined in accordance with these Provisions, substituted for $E_{mh}$, and applied as prescribed by the load combinations in the applicable building code.

Collector. Also known as drag strut; member that serves to transfer loads between diaphragms and the members of the vertical force-resisting elements of the seismic force-resisting system.

Column base. Assemblage of structural shapes, plates, connectors, bolts and rods at the base of a column used to transmit forces between the steel superstructure and the foundation.

Columnar system. A series of columns or column truss elements designed to support in-plane loading induced from multi-tiered braced frames.

Complete loading cycle. A cycle of rotation taken from zero force to zero force, including one positive and one negative peak.

Composite beam. Structural steel beam in contact with and acting compositely with a reinforced concrete slab designed to act compositely for seismic forces.

Composite brace. Concrete-encased structural steel section (rolled or built-up) or concrete-filled steel section used as a diagonal brace.

Composite column. Concrete-encased structural steel section (rolled or built-up) or concrete-filled steel section used as a column.

Composite eccentrically braced frame (C-EBF). Composite braced frame meeting the requirements of Section H3.

Composite intermediate moment frame (C-IMF). Composite moment frame meeting the requirements of Section G2.

Composite ordinary braced frame (C-OBF). Composite braced frame meeting the requirements of Section H1.

Composite ordinary moment frame (C-OMF). Composite moment frame meeting the requirements of Section G1.
Composite ordinary shear wall (C-OSW). Composite shear wall meeting the requirements of Section H4.

Composite partially restrained moment frame (C-PRMF). Composite moment frame meeting the requirements of Section G4.

Composite plate shear wall (C-PSW). Wall consisting of steel plate with reinforced concrete encasement on one or both sides that provides out-of-plane stiffening to prevent buckling of the steel plate and meeting the requirements of Section H6.

Composite shear wall. Steel plate wall panel composite with reinforced concrete wall panel or reinforced concrete wall that has steel or concrete-encased structural steel sections as boundary members.

Composite slab. Reinforced concrete slab supported on and bonded to a formed steel deck that acts as a diaphragm to transfer load to and between elements of the seismic force resisting system.

Composite special concentrically braced frame (C-SCBF). Composite braced frame meeting the requirements of Section H2.

Composite special moment frame (C-SMF). Composite moment frame meeting the requirements of Section G3.

Composite special shear wall (C-SSW). Composite shear wall meeting the requirements of Section H5.

Concrete-encased shapes. Structural steel sections encased in concrete.

Continuity plates. Column stiffeners at the top and bottom of the panel zone; also known as transverse stiffeners.

Coupling beam. Structural steel or composite beam connecting adjacent reinforced concrete wall elements so that they act together to resist lateral loads.

Demand critical weld. Weld so designated by these Provisions.

Design earthquake ground motion. The ground motion represented by the design response spectrum as specified in the applicable building code.

Design story drift. Calculated story drift, including the effect of expected inelastic action, due to design level earthquake forces as determined by the applicable building code.

Design strength*†. Resistance factor multiplied by the nominal strength, $\phi R_n$.

Diagonal brace. Inclined structural member carrying primarily axial force in a braced frame.

Ductile limit state. Ductile limit states include member and connection yielding, bearing deformation at bolt holes, as well as buckling of members that conform to the seismic compactness limitations of Table D1.1. Rupture of a member or of a connection, or buckling of a connection element, is not a ductile limit state.

Eccentrically braced frame (EBF). Diagonally braced frame meeting the requirements of Section F3 that has at least one end of each diagonal brace
connected to a beam with a defined eccentricity from another beam-to-brace connection or a beam-to-column connection.

Encased composite beam. Composite beam completely enclosed in reinforced concrete.

Encased composite column. Structural steel column completely encased in reinforced concrete.

Engineer of record. Licensed professional responsible for sealing the contract documents.

Exempted column. Column not meeting the requirements of Equation E3-1 for SMF.

Expected tensile strength*. Tensile strength of a member, equal to the specified minimum tensile strength, $F_{tu}$, multiplied by $R_t$.

Expected yield strength. Yield strength in tension of a member, equal to the expected yield stress multiplied by $A_g$.

Expected yield stress. Yield stress of the material, equal to the specified minimum yield stress, $F_{y}$, multiplied by $R_y$.

Face bearing plates. Stiffeners attached to structural steel beams that are embedded in reinforced concrete walls or columns. The plates are located at the face of the reinforced concrete to provide confinement and to transfer loads to the concrete through direct bearing.

Filled composite column. HSS filled with structural concrete.

Fully composite beam. Composite beam that has a sufficient number of steel headed stud anchors to develop the nominal plastic flexural strength of the composite section.

Highly ductile member. A member expected to undergo plastic rotation more than 0.02 rad from either flexure or flexural buckling under the design earthquake.

Horizontal boundary element (HBE). A beam with a connection to one or more web plates in an SPSW.

Intermediate boundary element (IBE). A member, other than a beam or column, that provides resistance to web plate tension adjacent to an opening in an SPSW.

Intermediate moment frame (IMF). Moment frame system that meets the requirements of Section E2.

Inverted-V-braced frame. See V-braced frame.

$k$-area. The region of the web that extends from the tangent point of the web and the flange-web fillet (AISC “$k$” dimension) a distance of 1½ in. (38 mm) into the web beyond the $k$ dimension.

$K$-braced frame. A braced-frame configuration in which two or more braces connect to a column at a point other than a beam-to-column or strut-to-column connection.
**Link.** In EBF, the segment of a beam that is located between the ends of the connections of two diagonal braces or between the end of a diagonal brace and a column. The length of the link is defined as the clear distance between the ends of two diagonal braces or between the diagonal brace and the column face.

**Link intermediate web stiffeners.** Vertical web stiffeners placed within the link in EBF.

**Link rotation angle.** Inelastic angle between the link and the beam outside of the link when the total story drift is equal to the design story drift.

**Link rotation angle, total.** The relative displacement of one end of the link with respect to the other end (measured transverse to the longitudinal axis of the undeformed link), divided by the link length. The total link rotation angle includes both elastic and inelastic components of deformation of the link and the members attached to the link ends.

**Link design shear strength.** Lesser of the available shear strength of the link based on the flexural or shear strength of the link member.

**Load-carrying reinforcement.** Reinforcement in composite members designed and detailed to resist the required loads.

**Lowest anticipated service temperature (LAST).** Lowest daily minimum temperature, or other suitable temperature, as established by the engineer of record.

**LRFD (load and resistance factor design).** Method of proportioning structural components such that the design strength equals or exceeds the required strength of the component under the action of the LRFD load combinations.

**LRFD load combination.** Load combination in the applicable building code intended for strength design (load and resistance factor design).

**Material test plate.** A test specimen from which steel samples or weld metal samples are machined for subsequent testing to determine mechanical properties.

**Member brace.** Member that provides stiffness and strength to control movement of another member out-of-the plane of the frame at the braced points.

**Moderately ductile member.** A member expected to undergo moderate plastic rotation (0.02 rad or less) from either flexure or flexural buckling under the design earthquake.

**Multi-tiered braced frame.** A braced-frame configuration with two or more tiers of bracing between diaphragm levels or locations of out-of-plane bracing.

**Nominal strength.** Strength of a structure or component (without the resistance factor or safety factor applied) to resist load effects, as determined in accordance with the Specification.

**Ordinary cantilever column system (OCCS).** A seismic force resisting-system in which the seismic forces are resisted by one or more columns that are
cantilevered from the foundation or from the diaphragm level below and that meets the requirements of Section E5.

Ordinary concentrically braced frame (OCBF). Diagonally braced frame meeting the requirements of Section F1 in which all members of the braced-frame system are subjected primarily to axial forces.

Ordinary moment frame (OMF). Moment frame system that meets the requirements of Section E1.

Overstrength factor, $\Omega_o$. Factor specified by the applicable building code in order to determine the overstrength seismic load, where required by these Provisions.

Overstrength Seismic Load. The horizontal seismic load effect including overstrength determined using the overstrength factor, $\Omega_o$, and applied as prescribed by the load combinations in the applicable building code.

Partially composite beam. Steel beam with a composite slab with a nominal flexural strength controlled by the strength of the steel headed stud anchors.

Partially-restrained composite connection. Partially restrained (PR) connections as defined in the Specification that connect partially or fully composite beams to steel columns with flexural resistance provided by a force couple achieved with steel reinforcement in the slab and a steel seat angle or comparable connection at the bottom flange.

Plastic hinge. Yielded zone that forms in a structural member when the plastic moment is attained. The member is assumed to rotate further as if hinged, except that such rotation is restrained by the plastic moment.

Prequalified connection. Connection that complies with the requirements of Section K1 or ANSI/AISC 358.

Protected zone. Area of members or connections of members in which limitations apply to fabrication and attachments.

Prototype. The connection or diagonal brace that is to be used in the building (SMF, IMF, EBF, BRBF, C-IMF, C-SMF and C-PRMF).

Provisions. Refers to this document, the AISC Seismic Provisions for Structural Steel Buildings (ANSI/AISC 341).

Quality assurance plan. Written description of qualifications, procedures, quality inspections, resources and records to be used to provide assurance that the structure complies with the engineer's quality requirements, specifications and contract documents.

Reduced beam section. Reduction in cross section over a discrete length that promotes a zone of inelasticity in the member.

Required strength*. Forces, stresses and deformations acting on a structural component, determined by either structural analysis, for the LRFD or ASD load combinations, as appropriate, or as specified by the Specification and these Provisions.
Resistance factor, $\phi^\dagger$. Factor that accounts for unavoidable deviations of the nominal strength from the actual strength and for the manner and consequences of failure.

Risk category. Classification assigned to a structure based on its use as specified by the applicable building code.

Safety factor, $\Omega^\dagger$. Factor that accounts for deviations of the actual strength from the nominal strength, deviations of the actual load from the nominal load, uncertainties in the analysis that transforms the load into a load effect, and for the manner and consequences of failure.

Seismic design category. A classification assigned to a structure based on its risk category and the severity of the design earthquake ground motion at the site.

Seismic force-resisting system (SFRS). That part of the structural system that has been considered in the design to provide the required resistance to the seismic forces prescribed in the applicable building code.

Seismic Response modification coefficient, $R$. Factor that reduces seismic load effects to strength level as specified by the applicable building code.

Special cantilever column system (SCCS). A seismic force resisting-system in which the seismic forces are resisted by one or more columns that are cantilevered from the foundation or from the diaphragm level below and that meets the requirements of Section E6.

Special concentrically braced frame (SCBF). Diagonally braced frame meeting the requirements of Section F2 in which all members of the braced-frame system are subjected primarily to axial forces.

Special moment frame (SMF). Moment frame system that meets the requirements of Section E3.

Special plate shear wall (SP$\psi$W). Plate shear wall system that meets the requirements of Section F5.

Special truss moment frame (STMF). Truss moment frame system that meets the requirements of Section E4.

Steel core. Axial-force-resisting element of a buckling-restrained brace. The steel core contains a yielding segment and connections to transfer its axial force to adjoining elements; it is permitted to also contain projections beyond the casing and transition segments between the projections and yielding segment.

Story drift angle. Interstory displacement divided by story height.

Strut. A horizontal member in a multi-tiered braced frame interconnecting brace connection points at columns.
Subassemblage test specimen. The combination of members, connections and testing apparatus that replicate as closely as practical the boundary conditions, loading and deformations in the prototype.

Test setup. The supporting fixtures, loading equipment and lateral bracing used to support and load the test specimen.

Test specimen. A member, connection or subassemblage test specimen.

Test subassemblage. The combination of the test specimen and pertinent portions of the test setup.

V-braced frame. Concentrically braced frame (SCBF, OCBF, BRBF, C-OBF or C-SCBF) in which a pair of diagonal braces located either above or below a beam is connected to a single point within the clear beam span. Where the diagonal braces are below the beam, the system is also referred to as an inverted-V-braced frame.

Vertical boundary element (VBE). A column with a connection to one or more web plates in an SPSW.

X-braced frame. Concentrically braced frame (OCBF, SCBF, C-OBF or C-SCBF) in which a pair of diagonal braces crosses near the mid-length of the diagonal braces.

Yield length ratio. In a buckling-restrained brace, the ratio of the length over which the core area is equal to $A_{sc}$, to the length from intersection points of brace centerline and beam or column centerline at each end.
ACRONYMS AND ABBREVIATIONS

The following acronyms appear in the AISC Seismic Provisions for Structural Steel Buildings. The acronyms are written out where they first appear within a Section.

ACI (American Concrete Institute)
AISC (American Institute of Steel Construction)
ANSI (American National Standards Institute)
ASCE (American Society of Civil Engineers)
ASD (allowable strength design)
AWS (American Welding Society)
BRBF (buckling-restrained braced frame)
C-EBF (composite eccentrically braced frame)
C-IMF (composite intermediate moment frame)
CJP (complete joint penetration)
C-OBF (composite ordinary braced frame)
C-OMF (composite ordinary moment frame)
C-OSW (composite ordinary shear wall)
C-PRMF (composite partially restrained moment frame)
CPRP (connection prequalification review panel)
C-PSW (composite plate shear wall)
C-SCBF (composite special concentrically braced frame)
C-SMF (composite special moment frame)
C-SSW (composite special shear wall)
CVN (Charpy V-notch)
EBF (eccentrically braced frame)
FCAW (flux cored arc welding)
FEMA (Federal Emergency Management Agency)
FR (fully restrained)
GMAW (gas metal arc welding)
HBE (horizontal boundary element)
HSS (hollow structural section)
IBE (intermediate boundary element)
IMF (intermediate moment frame)
LAST (lowest anticipated service temperature)
LRFD (load and resistance factor design)
MT (magnetic particle testing)
NDT (nondestructive testing)
OCBF (ordinary concentrically braced frame)
OCCS (ordinary cantilever column system)
OMF (ordinary moment frame)
OVS (oversized)
PJP (partial joint penetration)
PR (partially restrained)
ACRONYMS-2

QA (quality assurance)  
QC (quality control)  
RBS (reduced beam section)  
RCSC (Research Council on Structural Connections)  

SCBF (special concentrically braced frame)  
SCCS (special cantilever column system)  
SDC (seismic design category)  
SEI (Structural Engineering Institute)  
SFRS (seismic force-resisting system)  
SMAW (shielded metal arc welding)  
SMF (special moment frame)  
SPSPW (special perforated steel plate wall)  
SPSW (special plate shear wall)  
SRC (steel-reinforced concrete)  
STMF (special truss moment frame)  
UT (ultrasonic testing)  
VBE (vertical boundary element)  
WPQR (welder performance qualification records)  
WPS (welding procedure specification)
CHAPTER A

GENERAL REQUIREMENTS

This chapter states the scope of the Provisions, summarizes referenced specification, code and standard documents, and provides requirements for materials and contract documents.

The chapter is organized as follows:

A1. Scope
A2. Referenced Specifications, Codes and Standards
A3. Materials
A4. Structural Design Drawings and Specifications

A1. SCOPE

The Seismic Provisions for Structural Steel Buildings, hereafter referred to as these Provisions, shall govern the design, fabrication and erection of structural steel members and connections in the seismic force-resisting systems (SFRS), and splices and bases of columns in gravity framing systems of buildings and other structures with moment frames, braced frames and shear walls. Other structures are defined as those structures designed, fabricated and erected in a manner similar to buildings, with building-like vertical and lateral force-resisting elements. These Provisions shall apply to the design of seismic force-resisting systems of structural steel or of structural steel acting compositely with reinforced concrete, unless specifically exempted by the applicable building code.

Wherever these Provisions refer to the applicable building code and there is none, the loads, load combinations, system limitations, and general design requirements shall be those in ASCE/SEI 7.

User Note: ASCE/SEI 7 (Table 12.2-1, Item H) specifically exempts structural steel systems in seismic design categories B and C from the requirements in these Provisions if they are designed according to the Specification for Structural Steel Buildings and the seismic loads are computed using a seismic response modification factor, $R$, of 3; composite systems are not covered by this exemption. These Provisions do not apply in seismic design category A.
User Note: ASCE/SEI 7 (Table 12.2-1, Item H) specifically exempts structural steel systems, but not composite systems, from these Provisions in seismic design categories B and C if they are designed in accordance with the Specification for Structural Steel Buildings and the seismic loads are computed using a response modification coefficient, $R$, of 3. These Provisions do not apply in seismic design category A.

User Note: ASCE/SEI (Table 15.4-1) permits certain nonbuilding structures to be designed in accordance with the Specification for Structural Steel Buildings in lieu of the Provisions with an appropriately reduced $R$ factor.

User Note: Composite seismic force resisting systems include those systems with members of structural steel acting compositely with reinforced concrete, as well as systems in which structural steel members and reinforced concrete members act together to form a seismic force-resisting system.

These Provisions shall be applied in conjunction with the AISC Specification for Structural Steel Buildings, hereafter referred to as the Specification. All requirements of the Specification are applicable unless otherwise stated in these Provisions. Members and connections of the SFRS shall satisfy the requirements of the applicable building code, the Specification, and these Provisions. The phrases “is permitted” and “are permitted” in these Provisions identify provisions that comply with the Specification, but are not mandatory.

Building Code Requirements for Structural Concrete (ACI 318), as modified in these Provisions, shall be used for the design and construction of reinforced concrete components in composite construction. For the SFRS in composite construction incorporating reinforced concrete components designed in accordance with ACI 318, the requirements of Specification Section B3.1, Design for Strength Using Load and Resistance Factor Design, shall be used.

A2. REFERENCED SPECIFICATIONS, CODES AND STANDARDS

The documents referenced in these Provisions shall include those listed in Specification Section A2 with the following additions:

American Institute of Steel Construction (AISC)
ANSI/AISC 360-10 Specification for Structural Steel Buildings
ANSI/AISC 358-10 Prequalified Connections for Special and Intermediate Steel Moment Frames for Seismic Applications
American Welding Society (AWS)

AWS D1.8/D1.8M:2015 Structural Welding Code—Seismic Supplement

AWS B4.0:2015 Standard Methods for Mechanical Testing of Welds
(U.S. Customary Units)

AWS B4.0M:2000 Standard Methods for Mechanical Testing of Welds
(Metric Customary Units)

AWS D1.4/D1.4M:2005 Structural Welding Code—Reinforcing Steel
A3. MATERIALS

A3.1. Material Specifications

Structural steel used in the seismic force-resisting system (SFRS) shall satisfy the requirements of Specification Section A3.1, except as modified in these Provisions. The specified minimum yield stress of structural steel to be used for members in which inelastic behavior is expected shall not exceed 50 ksi (345 MPa) for systems defined in Chapters E, F, G and H, except that for systems defined in Sections E1, F1, G1, H1 and H4 this limit shall not exceed 55 ksi (380 MPa). Either of these specified minimum yield stress limits are permitted to be exceeded when the suitability of the material is determined by testing or other rational criteria.

Exception: Specified minimum yield stress of structural steel shall not exceed 70 ksi (450 MPa) for columns in systems defined in Sections E3, E4, G3, H1, H2 and H3, and for columns in all systems in Chapter F.

The structural steel used in the SFRS described in Chapters E, F, G and H shall meet one of the following ASTM Specifications:

(1) Hot-rolled structural shapes

   ASTM A36/A36M
   ASTM A529/A529M
   ASTM A572/A572M [Gr. 42 (290), 50 (345) or 55 (380)]
   ASTM A588/A588M
   ASTM A913/A913M [Gr. 50 (345), 60 (415), 65 (450) or 70 (485)]
   ASTM A992/A992M

(2) Hollow structural sections (HSS)

   ASTM A500/A500M (Gr. B or C)
   ASTM A501
   ASTM A1085/A1085M
   ASTM A53/A53M

(3) Plates

   ASTM A36/A36M
   ASTM A529/A529M
   ASTM A572/A572M [Gr. 42 (290), 50 (345) or 55 (380)]
   ASTM A588/A588M
   ASTM A1011/A1011M HSLAS Gr. 55 (380)
   ASTM A1043/A1043M
Bars

ASTM A36/A36M

ASTM A529/A529M

ASTM A572/A572M [Gr. 42 (290), 50 (345) or 55 (380)]

ASTM A588/A588M

Sheets

ASTM A1011/A1011M HSLAS Gr. 55 (380)

The structural steel used for column base plates shall meet one of the preceding ASTM specifications or ASTM A283/A283M Grade D.

Other steels and nonsteel materials in buckling-restrained braced frames are permitted to be used subject to the requirements of Sections F4 and K3.

User Note: This section only covers material properties for structural steel used in the SFRS and included in the definition of structural steel given in Section 2.1 of the AISC Code of Standard Practice. Other steel, such as cables for permanent bracing, is not covered. Steel reinforcement used in components in composite SFRS is covered in Section A3.6.

A3.2. Expected Material Strength

When required in these Provisions, the required strength of an element (a member or a connection of a member) shall be determined from the expected yield stress, \( R_y F_y \), of the member or an adjoining member, as applicable, where \( F_y \) is the specified minimum yield stress of the steel to be used in the member and \( R_y \) is the ratio of the expected yield stress to the specified minimum yield stress, \( F_y \), of that material.

When required to determine the nominal strength, \( R_n \), for limit states within the same member from which the required strength is determined, the expected yield stress, \( R_y F_y \), and the expected tensile strength, \( R_t F_u \), are permitted to be used in lieu of \( F_y \) and \( F_u \), respectively, where \( F_u \) is the specified minimum tensile strength and \( R_t \) is the ratio of the expected tensile strength to the specified minimum tensile strength, \( F_u \), of that material.

User Note: In several instances a member, or a connection limit state within that member, is required to be designed for forces corresponding to the expected strength of the member itself. Such cases include determination of the nominal strength, \( R_n \), of the beam outside of the link in EBF, diagonal brace rupture limit states (block shear rupture and net section rupture in the diagonal brace in SCBF), etc. In such cases it is permitted to use the expected material strength in the determination of...
available member strength. For connecting elements and for other members, specified material strength should be used.

The values of $R_y$ and $R_t$ for various steel and steel reinforcement materials are given in Table A3.1. Other values of $R_y$ and $R_t$ are permitted if the values are determined by testing of specimens, similar in size and source to the materials to be used, conducted in accordance with the testing requirements per the ASTM specifications for the specified grade of steel.

User Note: The expected compressive strength of concrete may be estimated using values from *Seismic Rehabilitation of Existing Buildings*, ASCE/SEI 41--06.

### A3.3. Heavy Sections

For structural steel in the SFRS, in addition to the requirements of *Specification* Section A3.1.c, hot rolled shapes with flange thickness equal to or greater than 1½ in. (38 mm) shall have a minimum Charpy V-notch toughness of 20 ft-lb (27 J) at 70°F (21°C), tested in the alternate core location as described in ASTM A6 Supplementary Requirement S30. Plates with thickness equal to or greater than 2 in. (50 mm) shall have a minimum Charpy V-notch toughness of 20 ft-lb (27 J) at 70°F (21°C), measured at any location permitted by ASTM A673, Frequency P, where the plate is used for the following:

- Members built up from plate
- Connection plates where inelastic strain under seismic loading is expected
- The steel core of buckling-restrained braces

### A3.4. Consumables for Welding

#### A3.4a. Seismic Force-Resisting System Welds

All welds used in members and connections in the SFRS shall be made with filler metals meeting the requirements specified in clause 6.3 of *Structural Welding Code—Seismic Supplement* (AWS D1.8/D1.8M), hereafter referred to as AWS D1.8/D1.8M.

User Note: AWS D1.8/D1.8M clauses 6.3.5, 6.3.6, 6.3.7 and 6.3.8 apply only to demand critical welds.

#### A3.4b. Demand Critical Welds

Welds designated as demand critical shall be made with filler metals meeting the requirements specified in AWS D1.8/D1.8M clause 6.3.
**User Note:** AWS D1.8/D1.8M requires that all seismic force-resisting system welds are to be made with filler metals classified using AWS A5 standards that achieve the following mechanical properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Classification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yield Strength, ksi (MPa)</td>
<td>70 ksi (480 MPa)</td>
</tr>
<tr>
<td>Tensile Strength, ksi (MPa)</td>
<td>58 (400) min.</td>
</tr>
<tr>
<td>Elongation, %</td>
<td>70 (480) min.</td>
</tr>
<tr>
<td>CVN Toughness, ft-lb (J)</td>
<td>22 min.</td>
</tr>
</tbody>
</table>

*Filler metals classified as meeting 20 ft-lbf (27 J) min. at a temperature lower than 0 °F (–18°C) also meet this requirement.*

In addition to the above requirements, AWS D1.8/D1.8M requires, unless otherwise exempted from testing, that all demand critical welds are to be made with filler metals receiving Heat Input Envelope Testing that achieve the following mechanical properties in the weld metal:

<table>
<thead>
<tr>
<th>Property</th>
<th>Classification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yield Strength, ksi (MPa)</td>
<td>70 ksi (480 MPa)</td>
</tr>
<tr>
<td>Tensile Strength, ksi (MPa)</td>
<td>58 (400) min.</td>
</tr>
<tr>
<td>Elongation (%)</td>
<td>70 (480) min.</td>
</tr>
<tr>
<td>CVN Toughness, ft-lb (J)</td>
<td>20 (27) min. @ 0 °F (–18°C)</td>
</tr>
</tbody>
</table>

*b For LAST of +50°F (+10°C). For LAST less than + 50°F (+10°C), see AWS D1.8/D1.8M clause 6.3.6.

*c Tests conducted in accordance with AWS D1.8/D1.8M Annex A meeting 40 ft-lb (54 J) min. at a temperature lower than +70°F (+20°C) also meet this requirement.*

**A3.5. Concrete and Steel Reinforcement**

Concrete and steel reinforcement used in composite components in composite intermediate or special SFRS of Sections G2, G3, G4, H2, H3, H5 and H6 shall satisfy the requirements of ACI 318 Chapter 18. Concrete and steel reinforcement used in composite components in...
A4. STRUCTURAL DESIGN DRAWINGS AND SPECIFICATIONS

A4.1. General

Structural design drawings and specifications shall indicate the work to be performed, and include items required by the Specification, the AISC Code of Standard Practice for Steel Buildings and Bridges, the applicable building code, and the following, as applicable:

1. Designation of the SFRS
2. Identification of the members and connections that are part of the SFRS
3. Locations and dimensions of protected zones, including a statement that the owner or owner’s designated representative for construction permanently mark the protected zone
4. Connection details between concrete floor diaphragms and the structural steel elements of the SFRS
5. Shop drawing and erection drawing requirements not addressed in Section 11

A4.2. Steel Construction

In addition to the requirements of Section A4.1, structural design drawings and specifications for steel construction shall indicate the following items, as applicable:

1. Configuration of the connections
2. Connection material specifications and sizes
3. Locations of demand critical welds
4. Locations where gusset plates are to be detailed to accommodate inelastic rotation
5. Locations of connection plates requiring Charpy V-notch toughness in accordance with Section A3.3(b)
6. Lowest anticipated service temperature (LAST) of the steel structure, if the structure is not enclosed and maintained at a temperature of 50°F (10°C) or higher
7. Locations where weld backing is required to be removed
(8) Locations where fillet welds are required when weld backing is permitted to remain

(9) Locations where fillet welds are required to reinforce groove welds or to improve connection geometry

(10) Locations where weld tabs are required to be removed

(11) Splice locations where tapered transitions are required

(12) The shape of weld access holes, if a shape other than those provided for in the Specification is required

(13) Joints or groups of joints in which a specific assembly order, welding sequence, welding technique or other special precautions where such items are designated to be submitted to the engineer of record

A4.3. Composite Construction

In addition to the requirements of Section A4.1, and the requirements of Section A4.2 as applicable for the steel components of reinforced concrete or composite elements, structural design drawings and specifications for composite construction shall indicate the following items, as applicable:

(1) Bar placement, cutoffs, lap and mechanical splices, hooks and mechanical anchorage, placement of ties and other transverse reinforcement

(2) Requirements for dimensional changes resulting from temperature changes, creep and shrinkage

(3) Location, magnitude and sequencing of any prestressing or post-tensioning present

(4) Location of steel headed stud anchors and welded reinforcing bar anchors
CHAPTER B
GENERAL DESIGN REQUIREMENTS

This chapter addresses the general requirements for the seismic design of steel structures that are applicable to all chapters of the Provisions.

This chapter is organized as follows:

B1. General Seismic Design Requirements
B2. Loads and Load Combinations
B3. Design Basis
B4. System Type

B1. GENERAL SEISMIC DESIGN REQUIREMENTS

The required strength and other seismic design requirements for seismic design categories, risk categories, and the limitations on height and irregularity shall be as specified in the applicable building code.

The design story drift and the limitations on story drift shall be determined as required in the applicable building code.

B2. LOADS AND LOAD COMBINATIONS

Where the required strength defined in these Provisions refers to the “overstrength seismic load,” the horizontal seismic load effect including overstrength shall be determined using the overstrength factor, \( \Omega_o \), and applied as prescribed by the load combinations in the applicable building code. Where the required strength defined in these Provisions refers to the “capacity-limited seismic load,” the capacity-limited horizontal seismic load effect, \( E_{cl} \), shall be determined in accordance with these Provisions, substituted for \( E_{mh} \), and applied as prescribed by the load combinations in the applicable building code.

**User Note:** The seismic load effect including overstrength is defined in ASCE/SEI 7, Section 12.4.3. In ASCE/SEI 7 Section 12.4.3.1, the horizontal seismic load effect, \( E_{mh} \), is determined using Equation 12.4-7:

\[
E_{mh} = \Omega_o Q_E.
\]

There is a cap on the value of \( E_{mh} \); it need not be taken larger than \( E_{cl} \). Thus, in effect, where these Provisions refer to “overstrength seismic load,” \( E_{mh} \) is permitted to be based upon the overstrength factor, \( \Omega_o \), or \( E_{cl} \). However, where “capacity-limited seismic load” is required, it is intended that \( E_{cl} \) replace \( E_{mh} \) as specified in ASCE/SEI 7 Section 12.4.3.2 and use of ASCE/SEI 7 Equation 12.4-7 is not permitted.
In composite construction, incorporating reinforced concrete components designed in accordance with the requirements of ACI 318, the requirements of Specification Section B3.1, Design for Strength Using Load and Resistance Factor Design, shall be used for the seismic force-resisting system (SFRS).

B3. **DESIGN BASIS**

B3.1. **Required Strength**

The required strength of structural members and connections shall be the greater of:

(a) The required strength as determined by structural analysis for the applicable load combinations, as stipulated in the applicable building code, and in Chapter C.

(b) The required strength given in Chapters D, E, F, G and H.

B3.2. **Available Strength**

The available strength is stipulated as the design strength, $\phi R_n$, for design in accordance with the provisions for load and resistance factor design (LRFD) and the allowable strength, $R_n/\Omega$, for design in accordance with the provisions for allowable strength design (ASD). The available strength of systems, members and connections shall be determined in accordance with the Specification, except as modified throughout these Provisions.

B4. **SYSTEM TYPE**

The seismic force-resisting system (SFRS) shall contain one or more moment frame, braced frame or shear wall system conforming to the requirements of one of the seismic systems designated in Chapters E, F, G and H.

B5. **DIAPHRAGMS, CHORDS AND COLLECTORS**

B5.1. **General**

Diaphragm collectors and all members and connections of truss diaphragms shall be designed for the load combinations in the applicable building code, including overstrength.

B5.2. **Truss Diaphragms**

When a truss is used as a diaphragm, all members of the truss and their connections shall be designed for forces calculated using the load combinations of the applicable building code, including overstrength.

Exceptions:
(a) The forces specified in this section need not be applied to the diagonal members of the truss diaphragms and their connections where these members and connections conform to the requirements of Sections F2.4a, F2.5a, F2.5b and F2.6c. Braces in K- or V-configurations are not permitted under this exception.

**User Note:** Chords in truss diaphragms serve a function analogous to columns in vertical SCBF, and should meet the requirements for highly ductile members as required for columns in Section F2.5a.

(b) The forces specified in this section need not be applied to truss diaphragms designed as a part of a three-dimensional system in which the seismic force-resisting system types consist of OMF, OCBF, or combinations thereof, and truss diagonal members conform to Sections F1.4b and F1.5 and connections conform to Section F1.6.
CHAPTER C

ANALYSIS

This chapter addresses design related analysis requirements. The chapter is organized as follows:

C1. General Requirements
C2. Additional Requirements
C3. Nonlinear Analysis

C1. GENERAL REQUIREMENTS

An analysis conforming to the requirements of the applicable building code and the Specification shall be performed for design of the system.

When the design is based upon elastic analysis, the stiffness properties of component members of steel systems shall be based on elastic sections and those of composite systems shall include the effects of cracked sections.

C2. ADDITIONAL REQUIREMENTS

Additional analysis shall be performed as specified in Chapters E, F, G and H of these Provisions.

C3. NONLINEAR ANALYSIS

When nonlinear analysis is used to satisfy the requirements of these Provisions, it shall be performed in accordance with the applicable building code.
CHAPTER D

GENERAL MEMBER AND CONNECTION DESIGN REQUIREMENTS

This chapter addresses general requirements for the design of members and connections.

The chapter is organized as follows:

D1. Member Requirements
D2. Connections
D3. Deformation Compatibility of Non-SFRS Members and Connections
D4. H-Piles

D1. MEMBER REQUIREMENTS

Members of moment frames, braced frames and shear walls in the seismic force-resisting system (SFRS) shall comply with the Specification and this section. Certain members of the SFRS that are expected to undergo inelastic deformation under the design earthquake are designated in these provisions as moderately ductile members or highly ductile members.

D1.1. Classification of Sections for Ductility

When required for the systems defined in Chapters E, F, G, H and Section D4, members designated as moderately ductile members or highly ductile members shall comply with this section.

D1.1a. Section Requirements for Ductile Members

Structural steel sections for both moderately ductile members and highly ductile members shall have flanges continuously connected to the web or webs.

Encased composite columns shall comply with the requirements of Section D1.4b.1 for moderately ductile members and Section D1.4b.2 for highly ductile members.

Filled composite columns shall comply with the requirements of Section D1.4c for both moderately and highly ductile members.

Concrete sections shall comply with the requirements of ACI 318 Section 18.4 for moderately ductile members and ACI 318 Section 18.6 and 18.7 for highly ductile members.

D1.1b. Width-to-Thickness Limitations of Steel and Composite Sections
For members designated as moderately ductile members, the width-to-thickness ratios of compression elements shall not exceed the limiting width-to-thickness ratios, $\lambda_{md}$, from Table D1.1.

For members designated as highly ductile members, the width-to-thickness ratios of compression elements shall not exceed the limiting width-to-thickness ratios, $\lambda_{hd}$, from Table D1.1.

</tbody>
</table>

For tee shaped compression members, the limiting width-to-thickness ratio for highly ductile members for the stem of the tee shall be $0.40 \frac{E}{\sqrt{R_y F_y}}$, where either of the following conditions are satisfied:

1. Buckling of the compression member occurs about the plane of the stem.
2. The axial compression load is transferred at end connections to only the outside face of the flange of the tee resulting in an eccentric connection that reduces the compression stresses at the tip of the stem.

The limiting width-to-thickness ratio of flanges of boxed I-shaped sections and built-up box sections of columns in SMF systems shall not exceed $0.63 \frac{E}{\sqrt{R_y F_y}}$.

For I-shaped beams in SMF systems, where $C_a$ is less than or equal to 0.114, the limiting ratio $h/t_w$ shall not exceed $2.57 \frac{E}{\sqrt{R_y F_y}}$. For I-shaped beams in IMF systems, where $C_a$ is less than or equal to 0.114, the limiting width-to-thickness ratio shall not exceed $3.95 \frac{E}{\sqrt{R_y F_y}}$.

The limiting diameter-to-thickness ratio of round HSS members used as beams or columns shall not exceed $0.077 \frac{E}{R_y F_y}$.

### D1.2. Stability Bracing of Beams

When required in Chapters E, F, G and H, stability bracing shall be provided as required in this section to restrain lateral-torsional buckling of structural steel or concrete-encased beams subject to flexure and designated as moderately ductile members or highly ductile members.

**User Note:** In addition to the requirements in Chapters E, F, G and H to provide stability bracing for various beam members such as intermediate and special moment frame beams, stability bracing is also required for columns in the special cantilever column system (SCCS) in Section E6.

### D1.2a. Moderately Ductile Members

1. The bracing of moderately ductile steel beams shall satisfy the following requirements:
(a) Both flanges of beams shall be laterally braced or the beam cross section shall be braced with torsional point bracing.

(b) Beam bracing shall meet the requirements of Appendix 6 of the Specification for lateral or torsional bracing of beams, where the required flexural strength of the member shall be:

\[ M_r = R_y F_y Z / \alpha_s \]  

(D1-1)

where

- \( C_d = 1.0 \)
- \( R_y = \) ratio of the expected yield stress to the specified minimum yield stress
- \( Z = \) plastic section modulus about the axis of bending, in.\(^3\) (mm\(^3\))
- \( \alpha_s = \) LRFD-ASD force level adjustment factor
  - 1.0 for LRFD and 1.5 for ASD

(c) Beam bracing shall have a maximum spacing of

\[ L_b = 0.19 r_y E / (R_y F_y) \]  

(D1-2)

2. The bracing of moderately ductile concrete-encased composite beams shall satisfy the following requirements:

(a) Both flanges of members shall be laterally braced or the beam cross section shall be braced with torsional point bracing.

(b) Lateral bracing shall meet the requirements of Appendix 6 of the Specification for lateral or torsional bracing of beams, where \( M_r = M_{p,exp} \) of the beam as specified in Section G2.6d, and \( C_d = 1.0 \).

(c) Member bracing shall have a maximum spacing of

\[ L_b = 0.19 r_y E / (R_y F_y) \]  

(D1-3)

using the material properties of the steel section and \( r_y \) in the plane of buckling calculated based on the elastic transformed section.

**D1.2b. Highly Ductile Members**

In addition to the requirements of Sections D1.2a.1(a) and (b), and D1.2a.2(a) and (b), the bracing of highly ductile beam members shall have a maximum spacing of \( L_b = 0.095 r_y E / (R_y F_y) \). For concrete-encased composite beams, the material properties of the steel section shall be used.
and the calculation for \( r_y \) in the plane of buckling shall be based on the elastic transformed section.

**D1.2c. Special Bracing at Plastic Hinge Locations**

Special bracing shall be located adjacent to expected plastic hinge locations where required by Chapters E, F, G or H.

(1) For structural steel beams, such bracing shall satisfy the following requirements:

(a) Both flanges of beams shall be laterally braced or the member cross section shall be braced with torsional point bracing.

(b) The required strength of lateral bracing of each flange provided adjacent to plastic hinges shall be:

\[
P_r = 0.06 R_y F_y Z / (\alpha_s h_o)
\]

\( (D1-4) \)

where

\( h_o = \) distance between flange centroids, in. (mm)

The required strength of torsional bracing provided adjacent to plastic hinges shall be:

\[
M_r = 0.06 R_y F_y Z / \alpha_s
\]

\( (D1-5) \)

(c) The required bracing stiffness shall satisfy the requirements of Appendix 6 of the *Specification* for lateral or torsional bracing of beams with \( C_d = 1.0 \) and where the required flexural strength of the beam shall be taken as:

\[
M_r = R_y F_y Z / \alpha_s
\]

\( (D1-6) \)

(2) For concrete-encased composite beams, such bracing shall satisfy the following requirements:

(a) Both flanges of beams shall be laterally braced or the beam cross section shall be braced with torsional point bracing.

(b) The required strength of lateral bracing provided adjacent to plastic hinges shall be:

\[
P_u = 0.06 M_{p,exp} / h_o
\]

\( (D1-7) \)

of the beam, where
\[ M_{p,\text{exp}} = \text{expected flexural strength of the steel, concrete-encased or composite beam, kip-in. (N-mm); determined in accordance with Section G2.6d.} \]

The required strength for torsional bracing provided adjacent to plastic hinges shall be \( M_u = 0.06 M_{p,\text{exp}} \) of the beam.

(c) The required bracing stiffness shall satisfy the requirements of Appendix 6 of the Specification for lateral or torsional bracing of beams where \( M_r = M_u = M_{p,\text{exp}} \) of the beam is determined in accordance with Section G2.6d, and \( C_d = 1.0 \).

**D1.3. Protected Zones**

Discontinuities specified in Section I2.1 resulting from fabrication and erection procedures and from other attachments are prohibited in the area of a member or a connection element designated as a protected zone by these Provisions or ANSI/AISC 358.

Exception: Welded steel headed stud anchors and other connections are permitted in protected zones when designated in ANSI/AISC 358, or as otherwise determined with a connection prequalification in accordance with Section K1, or as determined in a program of qualification testing in accordance with Sections K2 and K3.

**D1.4. Columns**

Columns in moment frames, braced frames and shear walls shall satisfy the requirements of this section.

**D1.4a. Required Strength**

The required strength of columns in the SFRS shall be determined from the greater effect of the following:

(a) The load effect resulting from the analysis requirements for the applicable system per Sections E, F, G and H.

(b) The compressive axial strength and tensile strength as determined using the overstrength seismic load. It is permitted to neglect applied moments in this determination unless the moment results from a load applied to the column between points of lateral support.
For columns that are common to intersecting frames, determination of the required axial strength, including the overstrength seismic load or the capacity-limited seismic load, as applicable, shall consider the potential for simultaneous inelasticity from all such frames. The direction of application of the load in each such frame shall be selected to produce the most severe load effect on the column.

Exceptions:

(a) It is permitted to limit the required axial strength for such columns based on a three-dimensional nonlinear analysis in which ground motion is simultaneously applied in two orthogonal directions, in accordance with Section C3.

(b) Columns that are part of Sections E1, F1, G1, H1, H4 or combinations thereof need not be designed for these loads.

D1.4b. Encased Composite Columns

Encased composite columns shall satisfy the requirements of Specification Chapter I, in addition to the requirements of this section. Additional requirements, as specified for moderately ductile members and highly ductile members in Sections D1.4b.1 and 2, shall apply as required in the descriptions of the composite seismic systems in Chapters G and H.

1. Moderately Ductile Members

Encased composite columns used as moderately ductile members shall satisfy the following requirements:

1. The maximum spacing of transverse reinforcement at the top and bottom shall be the least of the following:
   (i) one-half the least dimension of the section  
   (ii) 8 longitudinal bar diameters  
   (iii) 24 tie bar diameters  
   (iv) 12 in. (300 mm)

2. This spacing shall be maintained over a vertical distance equal to the greatest of the following lengths, measured from each joint face and on both sides of any section where flexural yielding is expected to occur:
   (i) one-sixth the vertical clear height of the column  
   (ii) the maximum cross-sectional dimension
(iii) 18 in. (450 mm)

(3) Tie spacing over the remaining column length shall not exceed twice the spacing defined in Section D1.4b.1(1).

(4) Splices and end bearing details for encased composite columns in composite ordinary SFRC of Sections G1, H1 and H4 shall satisfy the requirements of the *Specification* and ACI 318 Section 10.7. The design shall comply with ACI 318 Sections 18.2.7 and 18.2.8. The design shall consider any adverse behavioral effects due to abrupt changes in either the member stiffness or the nominal tensile strength. Transitions to reinforced concrete sections without embedded structural steel members, transitions to bare structural steel sections, and column bases shall be considered abrupt changes.

(5) Welded wire fabric shall be prohibited as transverse reinforcement.

2. **Highly Ductile Members**

Encased composite columns used as highly ductile members shall satisfy Section D1.4b.1 in addition to the following requirements:

(1) Longitudinal load-carrying reinforcement shall satisfy the requirements of ACI 318 Section 18.7.4.

(2) Transverse reinforcement shall be hoop reinforcement as defined in ACI 318 Chapter 18 and satisfy the following requirements:

(i) The minimum area of tie reinforcement, $A_{sh}$, shall be:

$$A_{sh} = 0.09h_{cc} s \left(1 - \frac{F_y A_x}{P_n} \right) \left(\frac{f'_c}{F_{ysr}}\right) \quad \text{(D1-8)}$$

where

$A_x = \text{cross-sectional area of the structural steel core, in.}^2 \text{ (mm}^2\text{)}$

$F_y = \text{specified minimum yield stress of the structural steel core, kpsi (MPa)}$

$F_{ysr} = \text{specified minimum yield stress of the ties, kpsi (MPa)}$

$P_n = \text{nominal compressive strength of the composite column calculated in accordance with the *Specification*, kips (N)}$
\( h_{cc} = \) cross-sectional dimension of the confined core measured center-to-center of the tie reinforcement, in. (mm)

\( f’_c = \) specified compressive strength of concrete, ksi (MPa)

\( s = \) spacing of transverse reinforcement measured along the longitudinal axis of the structural member, in. (mm)

Equation D1-8 need not be satisfied if the nominal strength of the concrete-encased structural steel section alone is greater than the load effect from a load combination of \( 1.0D+0.5L \),

where

\( D = \) dead load due to the weight of the structural elements and permanent features on the building, kips (N)

\( L = \) live load due to occupancy and moveable equipment, kips (N)

(ii) The maximum spacing of transverse reinforcement along the length of the column shall be the lesser of six longitudinal load-carrying bar diameters or 6 in. (150 mm).

(iii) Where transverse reinforcement is specified in Sections D1.4b.2(3), D1.4b.2(4), or D1.4b.2(5), the maximum of transverse reinforcement along the member length shall be the lesser of one-fourth the least member dimension or 4 in. (100 mm).” Confining reinforcement shall be spaced not more than 14 in. (350 mm) on center in the transverse direction.

(3) Encased composite columns in braced frames with required compressive strengths, not including the overstrength seismic load, greater than \( 0.2P_n \) shall have transverse reinforcement as specified in Section D1.4b.2(2)(iii) over the total element length. This requirement need not be satisfied if the nominal strength of the concrete-encased steel section alone is greater than the load effect from a load combination of \( 1.0D+0.5L \).

(4) Composite columns supporting reactions from discontinued stiff members, such as walls or braced
frames, shall have transverse reinforcement as specified in Section D1.4b.2(2)(iii) over the full length beneath the level at which the discontinuity occurs if the required compressive strength, not including the overstrength seismic load, exceeds $0.1P_n$. Transverse reinforcement shall extend into the discontinued member for at least the length required to develop full yielding in the concrete-encased steel section and longitudinal reinforcement. This requirement need not be satisfied if the nominal strength of the concrete-encased steel section alone is greater than the load effect from a load combination of $1.0D+0.5L$.

(5) Encased composite columns used in a C-SMF shall satisfy the following requirements:

(i) Transverse reinforcement shall satisfy the requirements in Section D1.4b.2(2) at the top and bottom of the column over the region specified in Section D1.4b.1(2).

(ii) The strong-column/weak-beam design requirements in Section G3.4a shall be satisfied. Column bases shall be detailed to sustain inelastic flexural hinging.

(iii) The required shear strength of the column shall satisfy the requirements of ACI 318 Section 18.7.6.1.

(6) When the column terminates on a footing or mat foundation, the transverse reinforcement as specified in this section shall extend into the footing or mat at least 12 in. (300 mm). When the column terminates on a wall, the transverse reinforcement shall extend into the wall for at least the length required to develop full yielding in the concrete-encased shape and longitudinal reinforcement.

D1.4c. Filled Composite Columns

This section applies to columns that meet the limitations of Specification Section I2.2. Such columns shall be designed to satisfy the requirements of Specification Chapter I, except that the nominal shear strength of the composite column shall be the nominal shear strength of the structural steel section alone, based on its effective shear area.

D1.5. Composite Slab Diaphragms
The design of composite floor and roof slab diaphragms for seismic effects shall meet the following requirements.

**D1.5a. Load Transfer**

Details shall be provided to transfer loads between the diaphragm and boundary members, collector elements, and elements of the horizontal framing system.

**D1.5b. Nominal Shear Strength**

The nominal in-plane shear strength of composite diaphragms and concrete slab on steel deck diaphragms shall be taken as the nominal shear strength of the reinforced concrete above the top of the steel deck ribs in accordance with ACI 318 excluding Chapter 14. Alternatively, the composite diaphragm nominal shear strength shall be determined by in-plane shear tests of concrete-filled diaphragms.

**D1.6. BUILT-UP STRUCTURAL STEEL MEMBERS**

This section addresses connections between components of built-up members where specific requirements are not provided in the system chapters of these Provisions or in ANSI/AISC 358.

Connections between components of built-up members subject to inelastic behavior shall be designed for the expected forces arising from that inelastic behavior.

Connections between components of built-up members where inelastic behavior is not expected shall be designed for the load effect including the overstrength seismic forces.

Where connections between elements of a built-up member are required in a protected zone, they shall develop the strength of the weaker connecting element.

Built-up members may be used in connections requiring testing per the Provisions provided they are accepted by ANSI/AISC 358 for use in a prequalified joint or have been verified in a qualification test.
D2. CONNECTIONS

D2.1. General

Connections, joints and fasteners that are part of the SFRS shall comply with Specification Chapter J, and with the additional requirements of this section.

Splices and bases of columns that are not designated as part of the SFRS shall satisfy the requirements of Sections D2.5a, D2.5c and D2.6.

Where protected zones are designated in connection elements by these Provisions or ANSI/AISC 358, they shall satisfy the requirements of Sections D1.3 and I2.1.

D2.2. Bolted Joints

Bolted joints shall satisfy the following requirements:

(a) The available shear strength of bolted joints using standard holes or short slotted holes perpendicular to the applied load shall be calculated as that for bearing-type joints in accordance with Specification Sections J3.6 and J3.10. The nominal bolt bearing and tearout equations per Section J3.10 of the Specification where deformation at the bolt hole at service load is a design consideration shall be used.

Exception: Where the required strength of a connection is based upon the expected strength of a member or element, it is permitted to use the bolt bearing and tearout equations in accordance with Specification Section J3.10 where deformation is not a design consideration.

(b) Bolts and welds shall not be designed to share force in a joint or the same force component in a connection.

User Note: A member force, such as a diagonal brace axial force, must be resisted at the connection entirely by one type of joint (in other words, either entirely by bolts or entirely by welds). A connection in which bolts resist a force that is normal to the force resisted by welds, such as a moment connection in which welded flanges transmit flexure and a bolted web transmits shear, is not considered to be sharing the force.

(c) Bolt holes shall be standard holes or short-slotted holes perpendicular to the applied load in bolted joints where the seismic load effects are transferred by shear in the bolts. Oversized holes, short-slotted holes, or long-slotted holes are permitted in connections where the seismic load effects are transferred by tension in the bolts but not by shear in the bolts.
Where approved by the engineer of record, long-slotted holes are also permitted where the seismic load effects are transferred by shear when the slot is perpendicular to the applied load.

Exception:

(1) For diagonal braces, oversized holes are permitted in one connection ply only when the connection is designed as a slip-critical joint.

(2) Alternative hole types are permitted if designated in ANSI/AISC 358, or if otherwise determined in a connection prequalification in accordance with Section K1, or if determined in a program of qualification testing in accordance with Section K2 or Section K3.

**User Note:** Diagonal brace connections with oversized holes must also satisfy other limit states including bolt bearing and bolt shear for the required strength of the connection as defined in Sections F1, F2, F3 and F4.

(d) All bolts shall be installed as pretensioned high-strength bolts. Faying surfaces shall satisfy the requirements for slip-critical connections in accordance with Specification Section J3.8 with a faying surface with a Class A slip coefficient or higher.

Exceptions: Connection surfaces are permitted to have coatings with a slip coefficient less than that of a Class A faying surface for the following:

(1) End plate moment connections conforming to the requirements of Section E1, or ANSI/AISC 358

(2) Bolted joints where the seismic load effects are transferred either by tension in bolts or by compression bearing but not by shear in bolts

### D2.3. Welded Joints

There are no additional welding requirements.

### D2.4. Continuity Plates and Stiffeners

The design of continuity plates and stiffeners located in the webs of rolled shapes shall allow for the reduced contact lengths to the member flanges and web based on the corner clip sizes in Section I2.4.

### D2.5. Column Splices
D2.5a. Location of Splices

For all building columns, including those not designated as part of the SFRS, column splices shall be located 4 ft (1.2 m) or more away from the beam-to-column flange connections.

Exceptions:

(a) When the column clear height between beam-to-column flange connections is less than 8 ft (2.4 m), splices shall be at half the clear height.

(b) Column splices with webs and flanges joined by complete-joint-penetration groove welds are permitted to be located closer to the beam-to-column flange connections, but not less than the depth of the column.

(c) Splices in composite columns

User Note: Where possible, splices should be located at least 4 ft (1.2 m) above the finished floor elevation to permit installation of perimeter safety cables prior to erection of the next tier and to improve accessibility.

D2.5b. Required Strength

The required strength of column splices in the SFRS shall be the greater of:

(a) The required strength of the columns, including that determined from Chapters E, F, G and H and Section D1.4a; or,

(b) The required strength determined using the overstrength seismic load.

In addition, welded column splices in which any portion of the column is subject to a calculated net tensile load effect determined using the overstrength seismic load shall satisfy all of the following requirements:

(a) The available strength of partial-joint-penetration (PJP) groove welded joints, if used, shall be at least equal to 200% of the required strength. Exception: Partial-joint penetration (PJP) groove welds are excluded from this requirement according to the exceptions to Sections E2.6g, E3.6g and E4.6c.

(b) The available strength for each flange splice shall be at least equal to $0.5R_yF_{y_{f}}b_{yf}t_f/\alpha_s$, where $R_yF_{y_{f}}$ is the expected yield stress of the column material and $b_{yf}$ is the area of one flange of the smaller column connected.
(c) Where butt joints in column splices are made with complete-joint-penetration groove welds, when tension stress at any location in the smaller flange exceeds $0.30 F_y / \alpha_t$ tapered transitions are required between flanges of unequal thickness or width. Such transitions shall be in accordance with AWS D1.8/D1.8M clause 4.2.

**D2.5c. Required Shear Strength**

For all building columns including those not designated as part of the SFRS, the required shear strength of column splices with respect to both orthogonal axes of the column shall be $M_{pc} / (\alpha_s H)$, where $M_{pc}$ is the lesser plastic flexural strength of the column sections for the direction in question, and $H$ is the height of the story, which is permitted to be taken as the distance between the centerline of floor framing at each of the levels above and below, or the distance between the top of floor slabs at each of the levels above and below.

The required shear strength of splices of columns in the SFRS shall be the greater of the above requirement or the required shear strength determined per Section D2.5b(a) and (b).

**D2.5d. Structural Steel Splice Configurations**

Structural steel column splices are permitted to be either bolted or welded, or welded to one column and bolted to the other. Splice configurations shall meet all specific requirements in Chapters E, F, G or H.

Splice plates or channels used for making web splices in SFRS columns shall be placed on both sides of the column web.

For welded butt joint splices made with groove welds, weld tabs shall be removed in accordance with AWS D1.8/D1.8M clause 6.11. Steel backing of groove welds need not be removed.

**D2.5e. Splices in Encased Composite Columns**

For encased composite columns, column splices shall conform to Section D1.4b and ACI 318 Section 18.7.4.3.

**D2.6. Column Bases**

The required strength of column bases, including those that are not designated as part of the SFRS, shall be calculated in accordance with this section.

The available strength of steel elements at the column base, including base plates, anchor rods, stiffening plates, and shear lug elements shall be in accordance with the *Specification*. 
Where columns are welded to base plates with groove welds, weld tabs and weld backing shall be removed, except that weld backing located on the inside of flanges and weld backing on the web of I-shaped sections need not be removed if backing is attached to the column base plate with a continuous 5/16-in. fillet weld. Fillet welds of backing to the inside of column flanges are prohibited.

The available strength of concrete elements and reinforcing steel at the column base shall be in accordance with ACI 318. When the design of anchor rods assumes that the ductility demand is provided for by deformations in the anchor rods and anchorage into reinforced concrete, the design shall meet the requirements of ACI 318 Chapter 17. Alternatively, when the ductility demand is provided for elsewhere, the anchor rods and anchorage into reinforced concrete are permitted to be designed for the maximum loads resulting from the deformations occurring elsewhere including the effects of material overstrength and strain hardening.

**User Note:** When using concrete reinforcing steel as part of the anchorage embedment design, it is important to consider the anchor failure modes and provide reinforcement that is developed on both sides of the expected failure surface. See ACI 318 Chapter 17, including Commentary.

### D2.6a. Required Axial Strength

The required axial strength of column bases that are designated as part of the SFRS, including their attachment to the foundation, shall be the summation of the vertical components of the required connection strengths of the steel elements that are connected to the column base, but not less than the greater of:

- (a) The column axial load calculated using the overstrength seismic load
- (b) The required axial strength for column splices, as prescribed in Section D2.5

**User Note:** The vertical components can include both the axial load from columns and the vertical component of the axial load from diagonal members framing into the column base. Section D2.5 includes references to Section D1.4a and Chapters E, F, G and H. Where diagonal braces frame to both sides of a column, the effects of compression brace buckling should be considered in the summation of vertical components. See Section F2.3.

### D2.6b. Required Shear Strength

The required shear strength of column bases, including those not designated as part of the SFRS, and their attachments to the foundations,
shall be the summation of the horizontal component of the required
connection strengths of the steel elements that are connected to the
column base as follows:

(a) For diagonal braces, the horizontal component shall be
determined from the required strength of diagonal brace
connections for the SFRS.

(b) For columns, the horizontal component shall be equal to the
lesser of the following:

(i) \(2R_yF_yZ/(\alpha_sH)\) of the column

(ii) The shear calculated using the overstrength seismic load.

(c) The summation of the required strengths of the horizontal
components shall not be less than \(0.7F_yZ/(\alpha_sH)\) of the column.

Exceptions:

(a) Single story columns with simple connections at both ends need
not comply with Section D2.6b(b) or D2.6b(c).

(b) The minimum required shear strength per Section D2.6b(c) need
not exceed the maximum load effect that can be transferred from
the column to the foundation as determined by either a nonlinear
analysis per Section C3, or an analysis that includes the effects of
inelastic behavior resulting in \(0.025H\) story drift at either the first
or second story, but not both concurrently.

User Note: The horizontal components can include the shear load from
columns and the horizontal component of the axial load from diagonal
members framing into the column base. Horizontal forces for columns
that are not part of the SFRS system can be determined from Section
D2.6b(c) as Section D2.6b(b) will typically not govern.

D2.6c. Required Flexural Strength

Where column bases are designed as moment connections to the
foundation, the required flexural strength of column bases that are
designated as part of the SFRS, including their attachment to the
foundation, shall be the summation of the required connection strengths
of the steel elements that are connected to the column base as follows:

(a) For diagonal braces, the required flexural strength shall be at least
equal to the required flexural strength of diagonal brace
connections.

(b) For columns, the required flexural strength shall be at least equal
to the lesser of the following:
1.1 \( R_y F_y Z / \alpha_s \) of the column, or

2. the moment calculated using the overstrength seismic load, provided that a ductile limit state in either the column base or the foundation controls the design.

**User Note:** Moments at column to column base connections designed as simple connections may be ignored.

### D2.7. Composite Connections

This section applies to connections in buildings that utilize composite steel and concrete systems wherein seismic load is transferred between structural steel and reinforced concrete components. Methods for calculating the connection strength shall satisfy the requirements in this section. Unless the connection strength is determined by analysis or testing, the models used for design of connections shall satisfy the following requirements:

(a) Force shall be transferred between structural steel and reinforced concrete through:

(1) direct bearing from internal bearing mechanisms;

(2) shear connection;

(3) shear friction with the necessary clamping force provided by reinforcement normal to the plane of shear transfer; or

(4) a combination of these means.

The contribution of different mechanisms is permitted to be combined only if the stiffness and deformation capacity of the mechanisms are compatible. Any potential bond strength between structural steel and reinforced concrete shall be ignored for the purpose of the connection force transfer mechanism.

(b) The nominal bearing and shear-friction strengths shall meet the requirements of ACI 318 Chapter 16. Unless a higher strength is substantiated by cyclic testing, the nominal bearing and shear-friction strengths shall be reduced by 25% for the composite seismic systems described in Sections G3, H2, H3, H5 and H6.

(c) Face bearing plates consisting of stiffeners between the flanges of steel beams shall be provided when beams are embedded in...
reinforced concrete columns or walls.

(d) The nominal shear strength of concrete-encased steel panel zones in beam-to-column connections shall be calculated as the sum of the nominal strengths of the structural steel and confined reinforced concrete shear elements as determined in Section E3.6e and ACI 318 Section 18.8, respectively.

(e) Reinforcement shall be provided to resist all tensile forces in reinforced concrete components of the connections. Additionally, the concrete shall be confined with transverse reinforcement. All reinforcement shall be fully developed in tension or compression, as applicable, beyond the point at which it is no longer required to resist the forces. Development lengths shall be determined in accordance with ACI 318 Chapter 25. Additionally, development lengths for the systems described in Sections G3, H2, H3, H5 and H6 shall satisfy the requirements of ACI 318 Section 18.8.5.

(f) Composite connections shall satisfy the following additional requirements:

(1) When the slab transfers horizontal diaphragm forces, the slab reinforcement shall be designed and anchored to carry the in-plane tensile forces at all critical sections in the slab, including connections to collector beams, columns, diagonal braces and walls.

(2) For connections between structural steel or composite beams and reinforced concrete or encased composite columns, transverse hoop reinforcement shall be provided in the connection region of the column to satisfy the requirements of ACI 318 Section 18.8, except for the following modifications:

(i) Structural steel sections framing into the connections are considered to provide confinement over a width equal to that of face bearing plates welded to the beams between the flanges.

(ii) Lap splices are permitted for perimeter ties when confinement of the splice is provided by face bearing plates or other means that prevents spalling of the concrete cover in the systems described in Sections G1, G2, H1 and H4.

(iii) The longitudinal bar sizes and layout in reinforced concrete and composite columns shall be detailed to minimize slippage of the bars through the
beam-to-column connection due to high force transfer associated with the change in column moments over the height of the connection.

**User Note:** The commentary provides guidance for determining panel zone shear strength.

### D2.8. Steel Anchors

Where steel headed stud anchors or welded reinforcing bar anchors are part of the intermediate or special SFRS of Sections G2, G3, G4, H2, H3, H5 and H6, their shear and tensile strength shall be reduced by 25% from the specified strengths given in *Specification* Chapter I.

**User Note:** The 25% reduction is not necessary for gravity and collector components in structures with intermediate or special seismic force-resisting systems designed for the overstrength seismic load.

### D3. DEFORMATION COMPATIBILITY OF NON-SFRS MEMBERS AND CONNECTIONS

Where deformation compatibility of members and connections that are not part of the seismic force-resisting system (SFRS) is required by the applicable building code, these elements shall be designed to resist the combination of gravity load effects and the effects of deformations occurring at the design story drift calculated in accordance with the applicable building code.

**User Note:** ASCE/SEI 7 stipulates the above requirement for both structural steel and composite members and connections. Flexible shear connections that allow member end rotations per Section J1.2 of the *Specification* should be considered to meet these requirements. Inelastic deformations are permitted in connections or members provided they are self-limiting and do not create instability in the member. See the Commentary for further discussion.

### D4. H-PILES

#### D4.1. Design Requirements

Design of H-piles shall comply with the requirements of the *Specification* regarding design of members subjected to combined loads. H-piles located in site classes E or F as defined by ASCE/SEI 7 shall satisfy the requirements for moderately ductile members of Section D1.1.

#### D4.2. Battered H-Piles

If battered (sloped) and vertical piles are used in a pile group, the vertical piles shall be designed to support the combined effects of the dead and live loads without the participation of the battered piles.
D4.3. Tension

Tension in each pile shall be transferred to the pile cap by mechanical means such as shear keys, reinforcing bars, or studs welded to the embedded portion of the pile.

D4.4. Protected Zone

At each pile, the length equal to the depth of the pile cross section located directly below the bottom of the pile cap shall be designated as a protected zone meeting the requirements of Sections D1.3 and I2.1.
CHAPTER E
MOMENT-FRAME SYSTEMS

This chapter provides the basis of design, the requirements for analysis, and the requirements for the system, members and connections for steel moment-frame systems. The chapter is organized as follows:

- E1. Ordinary Moment Frames (OMF)
- E2. Intermediate Moment Frames (IMF)
- E3. Special Moment Frames (SMF)
- E4. Special Truss Moment Frames (STMF)
- E5. Ordinary Cantilever Column Systems (OCCS)
- E6. Special Cantilever Column Systems (SCCS)

**User Note:** The requirements of this chapter are in addition to those required by the Specification and the applicable building code.

**E1. ORDINARY MOMENT FRAMES (OMF)**

**E1.1. Scope**
Ordinary moment frames (OMF) of structural steel shall be designed in conformance with this section.

**E1.2. Basis of Design**
OMF designed in accordance with these provisions are expected to provide minimal inelastic deformation capacity in their members and connections.

**E1.3. Analysis**
There are no additional analysis requirements beyond those in Chapters A, B, C and D of these Provisions.

**E1.4. System Requirements**
There are no additional system requirements.

**E1.5. Members**

**E1.5a. Basic Requirements**
There are no limitations on width-to-thickness ratios of members for OMF beyond those in the Specification. There are no requirements for stability bracing of beams or joints in OMF, beyond those in the Specification. Structural steel beams in OMF are permitted to be composite with a reinforced concrete slab to resist gravity loads.
E1.5b. Protected Zones

There are no designated protected zones for OMF members.

E1.6. Connections

Beam-to-column connections are permitted to be fully restrained (FR) or partially restrained (PR) moment connections in accordance with this section.

E1.6a. Demand Critical Welds

Complete-joint-penetration (CJP) groove welds of beam flanges to columns are demand critical welds, and shall satisfy the requirements of Section A3.4b and I2.3.

E1.6b. FR Moment Connections

FR moment connections that are part of the seismic force-resisting system (SFRS) shall satisfy at least one of the following requirements:

(a) FR moment connections shall be designed for a required flexural strength that is equal to the expected beam flexural strength, $R_yM_p$, times $1.1/\alpha_s$, where $\alpha_s = LRFD-ASD$ force level adjustment factor $= 1.0$ for LRFD and $1.5$ for ASD.

The required shear strength, $V_u$ or $V_a$, as applicable, of the connection shall be determined using the capacity-limited seismic load effect. The capacity-limited horizontal seismic load effect, $E_{cl}$, shall be taken as:

$$E_{cl} = \frac{2\left[1.1R_yM_p\right]}{L_c}$$

(E1-1)

where

- $L_c = \text{clear length of beam, in. (mm)}$
- $M_p = F_yZ$, kip-in. (N-mm)
- $R_y = \text{ratio of expected yield stress to the specified minimum yield stress, } F_y$

(b) FR moment connections shall be designed for a required flexural strength and a required shear strength equal to the maximum moment and corresponding shear that can be transferred to the connection by the system, including the effects of material overstrength and strain hardening.

User Note: Factors that may limit the maximum moment and corresponding shear that can be transferred to the connection include:

(1) the strength of the columns, and

(2) the resistance of the foundations to uplift.
For options (a) and (b) in Section E1.6b, continuity plates shall be provided as required by Sections J10.1, J10.2 and J10.3 of the Specification. The bending moment used to check for continuity plates shall be the same bending moment used to design the beam-to-column connection; in other words, \(1.1R\frac{M_p}{\alpha_s}\) or the maximum moment that can be transferred to the connection by the system.

(c) FR moment connections between wide flange beams and the flange of wide flange columns shall either satisfy the requirements of Section E2.6 or E3.6, or shall satisfy the following requirements:

1. All welds at the beam-to-column connection shall satisfy the requirements of Chapter 3 of ANSI/AISC 358.
2. Beam flanges shall be connected to column flanges using complete-joint-penetration groove welds.
3. The shape of weld access holes shall be in accordance with clause 6.10.1.2 of AWS D1.8/D1.8M. Weld access hole quality requirements shall be in accordance with clause 6.10.2 of AWS D1.8/D1.8M.
4. Continuity plates shall satisfy the requirements of Section E3.6f.

Exception: The welded joints of the continuity plates to the column flanges are permitted to be complete-joint-penetration groove welds, two-sided partial-joint-penetration groove welds with contouring fillets, two-sided fillet welds, or combinations of partial-joint-penetration groove welds and fillet welds. The required strength of these joints shall not be less than the available strength of the contact area of the plate with the column flange.

5. The beam web shall be connected to the column flange using either a CJP groove weld extending between weld access holes, or using a bolted single plate shear connection designed for required shear strength per Equation E1-1.

User Note: For FR moment connections, panel zone shear strength should be checked in accordance with Section J10.6 of the Specification. The required shear strength of the panel zone should be based on the beam end moments computed from the load combinations stipulated by the applicable building code, not including the overstrength seismic load.

E1.6c. PR Moment Connections

PR moment connections shall satisfy the following requirements:

(a) Connections shall be designed for the maximum moment and shear from the applicable load combinations as described in Sections B2 and B3.

(b) The stiffness, strength and deformation capacity of PR moment connections shall be included in the design, including the effect on overall frame stability.
(c) The nominal flexural strength of the connection, \( M_{n,PR} \), shall be no less than 50\% of \( M_p \) of the connected beam.

Exception: For one-story structures, \( M_{n,PR} \) shall be no less than 50\% of \( M_p \) of the connected column.

(d) \( V_u \) or \( V_\alpha \), as applicable, shall be determined per Section E1.6b(a) with \( M_p \) in Equation E1-1 taken as \( M_{n,PR} \).

E2. INTERMEDIATE MOMENT FRAMES (IMF)

E2.1. Scope

Intermediate moment frames (IMF) of structural steel shall be designed in conformance with this section.

E2.2. Basis of Design

IMF designed in accordance with these provisions are expected to provide limited inelastic deformation capacity through flexural yielding of the IMF beams and columns, and shear yielding of the column panel zones. Design of connections of beams to columns, including panel zones and continuity plates, shall be based on connection tests that provide the performance required by Section E2.6b, and demonstrate this conformance as required by Section E2.6c.

E2.3. Analysis

There are no additional analysis requirements beyond those in Chapters A, B, C, and D of these Provisions.

E2.4. System Requirements

E2.4a. Stability Bracing of Beams

Beams shall be braced to satisfy the requirements for moderately ductile members in Section D1.2a.

In addition, unless otherwise indicated by testing, beam braces shall be placed near concentrated forces, changes in cross section, and other locations where analysis indicates that a plastic hinge will form during inelastic deformations of the IMF. The placement of stability bracing shall be consistent with that documented for a prequalified connection designated in ANSI/AISC 358, or as otherwise determined in a connection prequalification in accordance with Section K1, or in a program of qualification testing in accordance with Section K2.

The required strength of lateral bracing provided adjacent to plastic hinges shall be as required by Section D1.2c.
E2.5. Members

E2.5a. Basic Requirements

Beam and column members shall satisfy the requirements of Section D1 for moderately ductile members, unless otherwise qualified by tests.

Structural steel beams in IMF are permitted to be composite with a reinforced concrete slab to resist gravity loads.

E2.5b. Beam Flanges

Changes in beam flange area in the protected zones, as defined in Section E2.5c, shall be gradual. The drilling of flange holes or trimming of beam flange width is not permitted unless testing or qualification demonstrates that the resulting configuration is able to develop stable plastic hinges to accommodate the required story drift angle. The configuration shall be consistent with a prequalified connection designated in ANSI/AISC 358, or as otherwise determined in a connection prequalification in accordance with Section K1, or in a program of qualification testing in accordance with Section K2.

E2.5c. Protected Zones

The region at each end of the beam subject to inelastic straining shall be designated as a protected zone, and shall satisfy the requirements of Section D1.3. The extent of the protected zone shall be as designated in ANSI/AISC 358, or as otherwise determined in a connection prequalification in accordance with Section K1, or as determined in a program of qualification testing in accordance with Section K2.

User Note: The plastic hinging zones at the ends of IMF beams should be treated as protected zones. The plastic hinging zones should be established as part of a prequalification or qualification program for the connection, per Section E2.6c. In general, for unreinforced connections, the protected zone will extend from the face of the column to one half of the beam depth beyond the plastic hinge point.

E2.6. Connections

E2.6a. Demand Critical Welds

The following welds are demand critical welds, and shall satisfy the requirements of Section A3.4b and I2.3:

(a) Groove welds at column splices
(b) Welds at column-to-base plate connections

Exception: Where it can be shown that column hinging at, or near, the base plate is precluded by conditions of restraint, and in the absence of net tension under load combinations including the overstrength seismic load, demand critical welds are not required.

(c) Complete-joint-penetration groove welds of beam flanges and beam webs to columns, unless otherwise designated by ANSI/AISC 358, or otherwise determined in a connection prequalification in accordance with Section K1, or as determined in a program of qualification testing in accordance with Section K2.

User Note: For the designation of demand critical welds, standards such as ANSI/AISC 358 and tests addressing specific connections and joints should be used in lieu of the more general terms of these Provisions. Where these Provisions indicate that a particular weld is designated demand critical, but the more specific standard or test does not make such a designation, the more specific standard or test should govern. Likewise, these standards and tests may designate welds as demand critical that are not identified as such by these Provisions.

E2.6b. Beam-to-Column Connection Requirements

Beam-to-column connections used in the SFRS shall satisfy the following requirements:

(a) The connection shall be capable of accommodating a story drift angle of at least 0.02 rad.

(b) The measured flexural resistance of the connection, determined at the column face, shall equal at least 0.80$M_p$ of the connected beam at a story drift angle of 0.02 rad.

E2.6c. Conformance Demonstration

Beam-to-column connections used in the SFRS shall satisfy the requirements of Section E2.6b by one of the following:

(a) Use of IMF connections designed in accordance with ANSI/AISC 358.

(b) Use of a connection prequalified for IMF in accordance with Section K1.

(c) Provision of qualifying cyclic test results in accordance with Section K2. Results of at least two cyclic connection tests shall be provided and are permitted to be based on one of the following:
(1) Tests reported in the research literature or documented tests performed for other projects that represent the project conditions, within the limits specified in Section K2.

(2) Tests that are conducted specifically for the project and are representative of project member sizes, material strengths, connection configurations, and matching connection processes, within the limits specified in Section K2.

**E2.6d. Required Shear Strength**

The required shear strength of the connection shall be determined using the capacity-limited seismic load effect. The capacity-limited horizontal seismic load effect, $E_{clh}$, shall be taken as:

$$E_{clh} = \frac{1.1R_y M_p}{L_h}$$

where

$L_h$ = distance between beam plastic hinge locations as defined within the test report or ANSI/AISC 358, in. (mm)

$M_p = F_y Z$ = plastic flexural strength, kip-in. (N-mm)

$R_y = \frac{F_y}{F_{y,min}}$ = ratio of the expected yield stress to the specified minimum yield stress, $F_{y,min}$

Exception: In lieu of Equation E2-1, the required shear strength of the connection shall be as specified in ANSI/AISC 358, or as otherwise determined in a connection prequalification in accordance with Section K1, or in a program of qualification testing in accordance with Section K2.

**E2.6e. Panel Zone**

There are no additional panel zone requirements.

*User Note:* Panel zone shear strength should be checked in accordance with Section J10.6 of the Specification. The required shear strength of the panel zone should be based on the beam end moments computed from the load combinations stipulated by the applicable building code, not including the overstrength seismic load.

**E2.6f. Continuity Plates**

Continuity plates shall be provided in accordance with the provisions of Section E3.6f.
E2.6g. Column Splices

Column splices shall comply with the requirements of Section E3.6g.

E3. SPECIAL MOMENT FRAMES (SMF)

E3.1. Scope

Special moment frames (SMF) of structural steel shall be designed in conformance with this section.

E3.2. Basis of Design

SMF designed in accordance with these provisions are expected to provide significant inelastic deformation capacity through flexural yielding of the SMF beams and limited yielding of column panel zones, or, where equivalent performance of the moment frame system is demonstrated by substantiating analysis and testing, through yielding of the connections of beams to columns. Except where otherwise permitted in this section, columns shall be designed to be stronger than the fully yielded and strain-hardened beams or girders. Flexural yielding of columns at the base is permitted. Design of connections of beams to columns, including panel zones and continuity plates, shall be based on connection tests that provide the performance required by Section E3.6b, and demonstrate this conformance as required by Section E3.6c.

E3.3. Analysis

For special moment frame systems that consist of isolated planar frames, there are no additional analysis requirements.

For moment frame systems that include columns that form part of two intersecting special moment frames in orthogonal or multi-axial directions, the column analysis of Section E3.4a shall consider the potential for beam yielding in both orthogonal directions simultaneously.

User Note: For these columns, the required axial loads are defined in Section D1.4a(b).

E3.4. System Requirements

E3.4a. Moment Ratio

The following relationship shall be satisfied at beam-to-column connections:

\[
\frac{\sum M_{Pc}}{\sum M_{Pb}} > 1.0
\]  

(E3-1)

where
\[ \Sigma M_{pc}^* = \text{sum of the projections of the nominal flexural strengths of the columns (including haunches where used) above and below the joint to the beam centerline with a reduction for the axial force in the column, kip-in. (N-mm). It is permitted to determine } \Sigma M_{pc}^* \text{ as follows:} \]

\[ \Sigma Z_c \left( F_{yc} - \alpha P_r / A_g \right) \quad (E3-2) \]

When the centerlines of opposing beams in the same joint do not coincide, the mid-line between centerlines shall be used.

\[ \Sigma M_{pb}^* = \text{sum of the projections of the expected flexural strengths of the beams at the plastic hinge locations to the column centerline, kip-in. (N-mm). It is permitted to determine } \Sigma M_{pb}^* \text{ as follows:} \]

\[ \Sigma (M_{pr} + \alpha M_v) \quad (E3-3) \]

\[ M_{pr} = \text{probable maximum moment at the location of the plastic hinge, as determined in accordance with ANSI/AISC 358, or as otherwise determined in a connection prequalification in accordance with Section K1, or in a program of qualification testing in accordance with Section K2, kip-in. (N-mm)} \]

\[ A_g = \text{gross area of column, in.}^2 \text{ (mm}^2) \]

\[ F_{yb} = \text{specified minimum yield stress of beam, ksi (MPa)} \]

\[ F_{yc} = \text{specified minimum yield stress of column, ksi (MPa)} \]

\[ M_v = \text{additional moment due to shear amplification from the location of the plastic hinge to the column centerline based on LRFD or ASD load combinations, kip-in. (N-mm)} \]

\[ Z_c = \text{plastic section modulus of the column about the axis of bending, in.}^3 \text{ (mm}^3) \]

\[ P_r = \text{required compressive strength according to Section D1.4a, kips (N)} \]

Exception: The requirement of Equation E3-1 shall not apply if the following conditions in (a) or (b) are satisfied.

(a) Columns with \( P_{rc} < 0.3P_r \) for all load combinations other than those determined using the overstrength seismic load and that satisfy either of the following:

(1) Columns used in a one-story building or the top story of a multistory building.

(2) Columns where: (1) the sum of the available shear strengths of all exempted columns in the story is less than 20% of the sum of the available shear strengths of all moment frame columns in the story acting in the same direction; and (2) the sum of the available shear strengths of all
exempted columns on each moment frame column line within that story is less than 33% of the available shear strength of all moment frame columns on that column line. For the purpose of this exception, a column line is defined as a single line of columns or parallel lines of columns located within 10% of the plan dimension perpendicular to the line of columns.

**User Note:** For purposes of this exception, the available shear strengths of the columns should be calculated as the limit strengths considering the flexural strength at each end as limited by the flexural strength of the attached beams, or the flexural strength of the columns themselves, divided by \( H \), where \( H \) is the story height.

The nominal compressive strength, \( P_c \), shall be

\[
P_c = \frac{F_{cc} A_k}{\alpha_s}\]  \(\text{(E3-5)}\)

and \( P_{rc} = P_{uc} \) (LRFD) or \( P_{rc} = P_{ac} \) (ASD), as applicable.

(b) Columns in any story that has a ratio of available shear strength to required shear strength that is 50% greater than the story above.

**E3.4b. Stability Bracing of Beams**

Beams shall be braced to satisfy the requirements for highly ductile members in Section D1.2b.

In addition, unless otherwise indicated by testing, beam braces shall be placed near concentrated forces, changes in cross section, and other locations where analysis indicates that a plastic hinge will form during inelastic deformations of the SMF. The placement of lateral bracing shall be consistent with that documented for a prequalified connection designated in ANSI/AISC 358, or as otherwise determined in a connection prequalification in accordance with Section K1, or in a program of qualification testing in accordance with Section K2.

The required strength of stability bracing provided adjacent to plastic hinges shall be as required by Section D1.2c.

**E3.4c. Stability Bracing at Beam-to-Column Connections**

1. **Braced Connections**

   When the webs of the beams and column are coplanar, and a column is shown to remain elastic outside of the panel zone, column flanges at beam-to-column connections shall require stability bracing only at the level of the top flanges of the beams. It is permitted to assume that the column remains elastic when the ratio calculated using Equation E3-1 is greater than 2.0.
When a column cannot be shown to remain elastic outside of the panel zone, the following requirements shall apply:

(a) The column flanges shall be laterally braced at the levels of both the top and bottom beam flanges. Stability bracing is permitted to be either direct or indirect.

**User Note:** Direct stability bracing of the column flange is achieved through use of member braces or other members, deck and slab, attached to the column flange at or near the desired bracing point to resist lateral buckling. Indirect stability bracing refers to bracing that is achieved through the stiffness of members and connections that are not directly attached to the column flanges, but rather act through the column web or stiffener plates.

(b) Each column-flange member brace shall be designed for a required strength that is equal to 2% of the available beam flange strength $F_{ybf} \times (1/\alpha_a)$.

### 2. Unbraced Connections

A column containing a beam-to-column connection with no member bracing transverse to the seismic frame at the connection shall be designed using the distance between adjacent member braces as the column height for buckling transverse to the seismic frame and shall conform to Specification Chapter H, except that:

(a) The required column strength shall be determined from the load combinations in the applicable building code that include the overstrength seismic load.

The overstrength seismic load, $E_{mh}$, need not exceed 125% of the frame available strength based upon either the beam available flexural strength or panel zone available shear strength.

(b) The slenderness $L/r$ for the column shall not exceed 60

where

\[
L = \text{length of column, in. (mm)}
\]

\[
r = \text{governing radius of gyration, in. (mm)}
\]

(c) The column required flexural strength transverse to the seismic frame shall include that moment caused by the application of the beam flange force specified in Section E3.4c(1)(b) in addition to the second-order moment due to the resulting column flange lateral displacement.

### E3.5. Members

#### E3.5a. Basic Requirements
Beam and column members shall satisfy the requirements of Section D1.1 for highly ductile members, unless otherwise qualified by tests. Structural steel beams in SMF are permitted to be composite with a reinforced concrete slab to resist gravity loads.

**E3.5b. Beam Flanges**

Abrupt changes in beam flange area are prohibited in plastic hinge regions. The drilling of flange holes or trimming of beam flange width are not permitted unless testing or qualification demonstrates that the resulting configuration can develop stable plastic hinges to accommodate the required story drift angle. The configuration shall be consistent with a prequalified connection designated in ANSI/AISC 358, or as otherwise determined in a connection prequalification in accordance with Section K1, or in a program of qualification testing in accordance with Section K2.

**E3.5c. Protected Zones**

The region at each end of the beam subject to inelastic straining shall be designated as a protected zone, and shall satisfy the requirements of Section D1.3. The extent of the protected zone shall be as designated in ANSI/AISC 358, or as otherwise determined in a connection prequalification in accordance with Section K1, or as determined in a program of qualification testing in accordance with Section K2.

**User Note:** The plastic hinging zones at the ends of SMF beams should be treated as protected zones. The plastic hinging zones should be established as part of a prequalification or qualification program for the connection, per Section E3.6c. In general, for unreinforced connections, the protected zone will extend from the face of the column to one half of the beam depth beyond the plastic hinge point.

**E3.6. Connections**

**E3.6a. Demand Critical Welds**

The following welds are demand critical welds, and shall satisfy the requirements of Section A3.4b and I2.3:

(a) Groove welds at column splices

(b) Welds at column-to-base plate connections

Exception: Where it can be shown that column hinging at, or near, the base plate is precluded by conditions of restraint, and in the absence of net tension under load combinations including the overstrength seismic load, demand critical welds are not required.
E-13

(c) Complete-joint-penetration groove welds of beam flanges and beam webs to columns, unless otherwise designated by ANSI/AISC 358, or otherwise determined in a connection prequalification in accordance with Section K1, or as determined in a program of qualification testing in accordance with Section K2.

User Note: For the designation of demand critical welds, standards such as ANSI/AISC 358 and tests addressing specific connections and joints should be used in lieu of the more general terms of these Provisions. Where these Provisions indicate that a particular weld is designated demand critical, but the more specific standard or test does not make such a designation, the more specific standard or test should govern. Likewise, these standards and tests may designate welds as demand critical that are not identified as such by these Provisions.

E3.6b. Beam-to-Column Connections

Beam-to-column connections used in the seismic force-resisting system (SFRS) shall satisfy the following requirements:

(a) The connection shall be capable of accommodating a story drift angle of at least 0.04 rad.

(b) The measured flexural resistance of the connection, determined at the column face, shall equal at least 0.80$M_p$ of the connected beam at a story drift angle of 0.04 rad, unless equivalent performance of the moment frame system is demonstrated through substantiating analysis conforming to SEI/ASCE 7 Sections 12.2.1.1 or 12.2.1.2.

E3.6c. Conformance Demonstration

Beam-to-column connections used in the SFRS shall satisfy the requirements of Section E3.6b by one of the following:

(a) Use of SMF connections designed in accordance with ANSI/AISC 358.

(b) Use of a connection prequalified for SMF in accordance with Section K1.

(c) Provision of qualifying cyclic test results in accordance with Section K2. Results of at least two cyclic connection tests shall be provided and shall be based on one of the following:

(1) Tests reported in the research literature or documented tests performed for other projects that represent the project conditions, within the limits specified in Section K2

(2) Tests that are conducted specifically for the project and are representative of project member sizes, material strengths, connection configurations,
and matching connection processes, within the limits specified in Section K2.

**E3.6d. Required Shear Strength**

The required shear strength of the connection shall be determined using the capacity-limited seismic load effect. The capacity-limited horizontal seismic load effect, $E_{cl}$, shall be taken as:

$$E_{cl} = \frac{2M_{pr}}{L_h}$$  \hspace{1cm} (E3-6)

where

- $L_h$ = distance between plastic hinge locations as defined within the test report or ANSI/AISC 358, in. (mm)
- $M_{pr}$ = maximum probable moment at the plastic hinge location, as defined in Section E3.4a, kip-in. (N-mm)

When $E_{cl}$ as defined in Equation E3-6 is used in ASD load combinations that are additive with other transient loads and that are based on ASCE/SEI 7, the 0.75 combination factor for transient loads shall not be applied to $E_{cl}$.

Where the exceptions to Equation E3-1 in Section E3.4a apply, the shear, $E_{cl}$, is permitted to be calculated based on the beam end moments corresponding to the expected strength of the column multiplied by 1.1.

**E3.6e. Panel Zone**

1. **Required Shear Strength**

The required shear strength of the panel zone shall be determined from the summation of the moments at the column faces as determined by projecting the expected moments at the plastic hinge points to the column faces. The design shear strength shall be $\phi_n R_n$ and the allowable shear strength shall be $R_n \Omega$, where

$$\phi_n = 1.00 \text{ (LRFD)} \quad \Omega = 1.50 \text{ (ASD)}$$

and the nominal shear strength, $R_n$, in accordance with the limit state of shear yielding, is determined as specified in Specification Section J10.6.

Alternatively, the required thickness of the panel zone shall be determined in accordance with the method used in proportioning the panel zone of the tested or prequalified connection.

Where the exceptions to Equation E3-1 in Section E3.4a apply, the beam moments used in calculating the required shear strength of the panel zone...
2. Panel Zone Thickness

The thickness of doubler plates, if used, shall not be less than 0.25 in. (6 mm).

In addition, the individual thicknesses, \( t \), of column webs and doubler plates, if used, shall conform to the following requirement:

\[
 t \geq \left( \frac{d_z + w_z}{90} \right)
\]

(E3-7)

where

\[
 d_z = d - 2t_f \text{ of the deeper beam at the connection, in. (mm)}
\]

\[
 t = \text{thickness of column web or doubler plate, in. (mm)}
\]

\[
 w_z = \text{width of panel zone between column flanges, in. (mm)}
\]

When plug welds are used, the total panel zone thickness shall satisfy Equation E3-7. Additionally, the individual thicknesses of the column web and doubler plate shall satisfy Equation E3-7, where \( d_z \) and \( w_z \) are modified to be the distance between plug welds. When plug welds are required, a minimum of four plug welds shall be provided.

3. Panel Zone Doubler Plates

When used, doubler plates shall meet the following requirements.

Where the required strength of the panel zone exceeds the design strength, or where the panel zone does not comply with Equation E3-7, doubler plates shall be provided. Doubler plates shall be placed in contact with the web, or shall be spaced away from the web. Doubler plates with a gap of up to 1/16 in. (2 mm) between the doubler plate and the column web are permitted to be designed as being in contact with the web. When doubler plates are spaced away from the web, they shall be placed symmetrically in pairs on opposite sides of the column web.

Doubler plates in contact with the web shall be welded to the column flanges either using partial-joint-penetration groove welds in accordance with AWS D1.8/D1.8M clause 4 that extend from the surface of the doubler plate to the column flange, or by using fillet welds. Spaced doubler plates shall be welded to the column flanges. The required strength of fillet welds shall equal the available shear yield strength of the doubler plate thickness.

(a) Doubler plates used without continuity plates

Doubler plates and the welds connecting the doubler plates to the column flanges shall extend at least 6 in. (150 mm) above and below the top and bottom of the deeper moment frame beam. For doubler plates in contact
with the web, if the doubler plate thickness alone and the column web thickness alone both satisfy Equation E3-7, then no weld is required along the top and bottom edges of the doubler plate. If either the doubler plate thickness alone or the column web thickness alone does not satisfy Equation E3-7, then a minimum size fillet weld, as stipulated in Specification Table J2.4, shall be provided along the top and bottom edges of the doubler plate. These welds shall terminate 1.5 in. (75 mm) from the toe of the column fillet.

(b) Doubler plates used with continuity plates

Doubler plates are permitted to be either extended above and below the continuity plates, or may be placed between the continuity plates.

(i) Extended doubler plates

Extended doubler plates shall be in contact with the web. Extended doubler plates and the welds connecting the doubler plates to the column flanges shall extend at least 6 in. (150 mm) above and below the top and bottom of the deeper moment frame beam. Continuity plates shall be welded to the extended doubler plates in accordance with the requirements in Section E3.6f.2(c) for welding continuity plates to the column web. No welds are required at the top and bottom edges of the doubler plate.

(ii) Doubler plates placed between continuity plates

Doubler plates placed between continuity plates are permitted to be in contact with the web or away from the web. Welds between the doubler plate and the column flanges shall extend between continuity plates, but are permitted to stop no more than 1 in. (25 mm) from the continuity plate. The top and bottom of the doubler plate shall be welded to the continuity plates over the full length of the continuity plates in contact with the column web. The required strength of the doubler plate to continuity plate weld shall equal 75% of the available shear yield strength of the full doubler plate thickness over the contact length with the continuity plate.

E3.6f. Continuity Plates

Continuity plates shall be provided as required by this section.

Exception: This section shall not apply in the following cases:

(a) Where continuity plates are otherwise determined in a connection prequalification in accordance with Section K1.

(b) Where a connection is qualified in accordance with Section K2 for conditions in which the test assembly omits continuity plates and matches the prototype beam and column sizes and beam span.
1. Conditions Requiring Continuity Plates

Continuity plates shall be provided in the following cases:

(a) Where the required strength at the column face exceeds the available column strength determined using applicable local limit states stipulated in Specification Section J10, where applicable. Where so required, continuity plates shall meet the requirements of Specification Section J10.8 and the requirements of Section E3.6f.2.

For connections in which the beam flange is welded to the column flange and no reinforcement is present the column shall have an available strength sufficient to resist an applied force as determined by Equation E3-8:

\[ P_f = \frac{M_f b_f t_f}{\alpha Z_x} \]  \hspace{1cm} (E3-8)

where
\[ M_f = \text{probable maximum moment at face of column as defined in ANSI/AISC 358 for a prequalified moment connection or as determined from qualification testing, kip-in. (N-mm)} \]
\[ b_f = \text{width of beam flange, in. (mm)} \]
\[ t_f = \text{beam flange thickness, in. (mm)} \]
\[ P_f = \text{required strength at the column face for local limit states in the column, kip (N)} \]
\[ Z_x = \text{plastic section modulus of the beam, in.}^3 \text{ (mm}^3\text{)} \]

(b) Where the column-flange thickness is less than the limiting thickness, \( t_{lim} \), determined per this provision.

(i) Where the beam flange is welded to the flange of a wide-flange or built-up I-shaped column, the limiting column-flange thickness is

\[ t_{lim} = \frac{b_f}{6} \]  \hspace{1cm} (E3-9)

where
\[ t_{lim} = \text{limiting column flange thickness, in. (mm)} \]

(ii) Where the beam flange is welded to the flange of the I-shape in a boxed wide-flange column, the limiting column-flange thickness is:

\[ t_{lim} = \frac{b_f}{12} \]  \hspace{1cm} (E3-10)

(c) Where the column is a box section.
2. **Continuity Plate Requirements**

Where continuity plates are required, they shall meet the requirements of this section.

(a) **Continuity Plate Width**

The width of the continuity plate shall be determined as follows:

(i) For W-shape columns, continuity plates shall, at a minimum, extend from the column web to a point opposite the tips of the wider beam flanges.

(ii) For boxed wide flange columns, continuity plates shall extend the full width from column web to side plate of the column.

(b) **Continuity Plate Thickness**

The minimum thickness of the plates shall be determined as follows:

(i) For one-sided connections, the continuity plate thickness shall be at least one-half of the thickness of the beam flange.

(ii) For two-sided connections, the continuity plate thickness shall be equal to the thicker of the two beam flanges on either side of the column.

(c) **Continuity Plate Welding**

Continuity plates shall be welded to column flanges using CJP groove welds.

Continuity plates shall be welded to column webs or extended doubler plates using groove welds or fillet welds. The required strength of the welded joints of continuity plates to the column web or extended doubler plate shall be the lesser of the following:

(i) The sum of the available strengths in tension of the contact areas of the continuity plates to the column flanges that have attached beam flanges

(ii) The available strength in shear of the contact area of the plate with the column web or extended doubler plate

(iii) The available strength in shear of the column web, when the continuity plate is welded to the column web, or the available strength in shear of the doubler plate, when the continuity plate is welded to an extended doubler plate

**E3.6g. Column Splices**
Column splices shall comply with the requirements of Section D2.5. Where welds are used to make the flange splices, they shall be complete-joint-penetration groove welds.

Exception: The required strength of the column splice including appropriate stress concentration factors or fracture mechanics stress intensity factors need not exceed that determined by a nonlinear analysis as specified in Chapter C. For columns with specified minimum yield stress not exceeding 60 ksi (415 MPa), partial-joint-penetration groove welds are permitted under the following conditions:

(a) The thicker flange is at least 15% thicker than the thinner flange.
(b) The partial-joint-penetration flange welds have a minimum effective throat of 95% of the thickness of the thinner column flange, and the thickness of the thinner flange is less than 2 1/2 in. (64 mm). Alternatively, if the welds are double sided (i.e., on both sides of the flange) with the unfused section centered on the centerline of the thinner flange, the minimum effective throat shall be a minimum of 90% of the thickness of the thinner flange. In this case, the thickness of the thinner flange may be as large as 3 1/2 in. (89 mm).
(c) A smooth transition in the thickness of the weld is provided from the outside of the thinner flange to the outside of the thicker flange. The smooth transition is defined as one made by sloping the surface of the weld, such that (1) the slope is not greater than 1 in 2.5, and (2) an effective throat equal to the thickness of the smaller flange is maintained in the plane of the weld root.
(d) Tapered transitions between column flanges of different width shall be provided in accordance with Section D2.5(b).
(e) Where single-sided welds are used, weld access holes are not required. If double-sided partial-penetration groove welds are used weld access holes in compliance with AWS D1.8 are required.
(f) The web splice is a complete-joint-penetration groove weld. Alternatively, the web splice is permitted to be a partial-joint-penetration groove weld with an effective throat of 85% of the thinner web in the following cases: (1) the thicker web is at least 30% thicker than the thinner web, if the weld is single-sided, or (2) the thicker web is at least 15% thicker than the thinner web, if the welds are double-sided (i.e., on both sides of the web). In either case, a smooth transition in the thickness of the weld shall be provided from the outside of the thinner web to the outside of the thicker web.

When bolted column splices are used, they shall have a required flexural strength that is at least equal to $R_y F / \alpha_s$ of the smaller column, where $Z_x$ is the plastic section modulus about the $x$-axis. The required shear strength of column web splices shall be at least equal to $\Sigma M_p / (\alpha_s H_c)$, where $\Sigma M_p$ is the sum of the plastic flexural strengths at the top and bottom ends of the column.
E4. SPECIAL TRUSS MOMENT FRAMES (STMF)

E4.1. Scope
Special truss moment frames (STMF) of structural steel shall satisfy the requirements in this Section.

E4.2. Basis of Design
STMF designed in accordance with these provisions are expected to provide significant inelastic deformation capacity within a special segment of the truss. STMF shall be limited to span lengths between columns not to exceed 65 ft (20 m) and overall depth not to exceed 6 ft (1.8 m). The columns and truss segments outside of the special segments shall be designed to remain elastic under the forces that are generated by the fully yielded and strain-hardened special segment.

E4.3. Analysis
Analysis of STMF shall satisfy the following requirements.

E4.3a. Special Segment
The required vertical shear strength of the special segment shall be calculated for the applicable load combinations in the applicable building code.

E4.3b. Nonspecial Segment
The required strength of nonspecial segment members and connections, including column members, shall be determined using the capacity-limited horizontal seismic load effect. The capacity-limited horizontal seismic load effect, $E_{ch}$, shall be taken as the lateral forces necessary to develop the expected vertical shear strength of the special segment acting at mid-length and defined in Section E4.5c. Second order effects at maximum design drift shall be included.

E4.4. System Requirements

E4.4a. Special Segment
Each horizontal truss that is part of the SFRS shall have a special segment that is located between the quarter points of the span of the truss. The length of the special segment shall be between 0.1 and 0.5 times the truss span length. The length-to-depth ratio of any panel in the special segment shall neither exceed 1.5 nor be less than 0.67.
Panels within a special segment shall either be all Vierendeel panels or all X-braced panels; neither a combination thereof nor the use of other truss diagonal configurations is permitted. Where diagonal members are used in the special segment, they shall be arranged in an X pattern separated by vertical members. Diagonal members within the special segment shall be made of rolled flat bars of identical sections. Such diagonal members shall be interconnected at points where they cross. The interconnection shall have a required strength equal to 0.25 times the nominal tensile strength of the diagonal member. Bolted connections shall not be used for diagonal members within the special segment.

Splicing of chord members is not permitted within the special segment, nor within one-half the panel length from the ends of the special segment.

The required axial strength of the diagonal web members in the special segment due to dead and live loads within the special segment shall not exceed

$$0.03F_{y}A_{g}/\alpha_{s}$$

**E4.4b. Stability Bracing of Trusses**

Each flange of the chord members shall be laterally braced at the ends of the special segment. The required strength of the lateral brace shall be

$$P_{r} = 0.06R_{e}F_{y}A_{f}/\alpha_{s}$$ \hspace{1cm} (E4-1)

where

$$A_{f} = \text{gross area of the flange of the special segment chord member, in}^{2}$$ \hspace{1cm} (mm$^{2}$)

**E4.4c. Stability Bracing of Truss-to-Column Connections**

The columns shall be laterally braced at the levels of top and bottom chords of the trusses connected to the columns. The lateral braces shall have a required strength of

$$P_{r} = 0.02R_{y}P_{nc}/\alpha_{s}$$ \hspace{1cm} (E4-2)

where

$$P_{nc} = \text{nominal compressive strength of the chord member at the ends, kips}$$ \hspace{1cm} (N)

**E4.4d. Stiffness of Stability Bracing**
The required brace stiffness shall meet the provisions of Specification Appendix 6, Section 6.2, where

\[ P_r = \frac{R_y P_{\text{ww}}}{\alpha_s} \]  

(E4-2)

where

\[ P_r = \text{required axial compressive strength, kips (N)} \]

E4.5. Members

E4.5a. Basic Requirements

Columns shall satisfy the requirements of Section D1.1 for highly ductile members.

E4.5b. Special Segment Members

The available shear strength of the special segment shall be calculated as the sum of the available shear strength of the chord members through flexure, and of the shear strength corresponding to the available tensile strength and 0.3 times the available compressive strength of the diagonal members, when they are used. The top and bottom chord members in the special segment shall be made of identical sections and shall provide at least 25% of the required vertical shear strength.

The available strength, \( \phi P_n \) (LRFD) and \( P_n / \Omega \) (ASD), determined in accordance with the limit state of tensile yielding, shall be equal to or greater than 2.2 times the required strength, where

\[ \phi = 0.90 \text{ (LRFD)} \quad \Omega = 1.67 \text{ (ASD)} \]

\[ P_n = F_y A_g \]  

(E4-4)

E4.5c. Expected Vertical Shear Strength of Special Segment

The expected vertical shear strength of the special segment, \( V_{\text{nc}} \), at mid-length, shall be:

\[ V_{\text{nc}} = \frac{3.60 R_y M_{\text{nc}}}{L_s} + 0.036 E I \frac{L}{L_s^2} + R_y \left( P_{\text{nc}} + 0.3 P_w \right) \sin \alpha \]  

(E4-5)

where

\[ E = \text{modulus of elasticity of a chord member of the special segment, ksi (MPa)} \]

\[ I = \text{moment of inertia of a chord member of the special segment, in.}^4 \text{ (mm}^4) \]
E4.5d. Width-to-Thickness Limitations

Chord members and diagonal web members within the special segment shall satisfy the requirements of Section D1.1b for highly ductile members. The width-to-thickness ratio of flat bar diagonal members shall not exceed 2.5.

E4.5e. Built-Up Chord Members

Spacing of stitching for built-up chord members in the special segment shall not exceed $0.04\frac{E_r}{F_y}$, where $r_y$ is the radius of gyration of individual components about their weak axis.

E4.5f. Protected Zones

The region at each end of a chord member within the special segment shall be designated as a protected zone meeting the requirements of Section D1.3. The protected zone shall extend over a length equal to two times the depth of the chord member from the connection with the web members. Vertical and diagonal web members from end-to-end of the special segments shall be protected zones.

E4.6. Connections

E4.6a. Demand Critical Welds

The following welds are demand critical welds, and shall satisfy the requirements of Section A3.4b and I2.3:

(a) Groove welds at column splices
(b) Welds at column-to-base plate connections
Exception: Where it can be shown that column hinging at, or near, the base plate is precluded by conditions of restraint, and in the absence of net tension under load combinations including the overstrength seismic load, demand critical welds are not required.

**E4.6b. Connections of Diagonal Web Members in the Special Segment**

The end connection of diagonal web members in the special segment shall have a required strength that is at least equal to the expected yield strength of the web member, determined as $R_y F_y A_y / \alpha_s$.

**E4.6c. Column Splices**

Column splices shall comply with the requirements of Section E3.6g.

**E5. ORDINARY CANTILEVER COLUMN SYSTEMS (OCCS)**

**E5.1. Scope**

Ordinary cantilever column systems (OCCS) of structural steel shall be designed in conformance with this section.

**E5.2. Basis of Design**

OCCS designed in accordance with these provisions are expected to provide minimal inelastic drift capacity through flexural yielding of the columns.

**E5.3. Analysis**

There are no additional analysis requirements beyond those in Chapters A, B, C, and D of these Provisions.

**E5.4. System Requirements**

**E5.4a. Columns**

Columns shall be designed using the load combinations including the overstrength seismic load. The required axial strength, $P_\alpha$, shall not exceed 15% of the available axial strength, $P_\alpha$, for these load combinations only.
E5.4b. Stability Bracing of Columns

There are no additional stability bracing requirements for columns.

E5.5. Members

E5.5a. Basic Requirements

There are no additional requirements.

E5.5b. Column Flanges

There are no additional column flange requirements.

E5.5c. Protected Zones

There are no designated protected zones.

E5.6. Connections

E5.6a. Demand Critical Welds

No demand critical welds are required for this system.

E5.6b. Column Bases

Column bases shall be designed in accordance with Section D2.6.

E6. SPECIAL CANTILEVER COLUMN SYSTEMS (SCCS)

E6.1. Scope

Special cantilever column systems (SCCS) of structural steel shall be designed in conformance with this section.
E6.2. Basis of Design

SCCS designed in accordance with these provisions are expected to provide limited inelastic drift capacity through flexural yielding of the columns.

E6.3. Analysis

There are no additional analysis requirements beyond those in Chapters A, B, C, and D of these Provisions.

E6.4. System Requirements

E6.4a. Columns

Columns shall be designed using the load combinations including the overstrength seismic load. The required strength, $P_{rc}$, shall not exceed 15% of the available axial strength, $P_c$, for these load combinations only.

E6.4b. Stability Bracing of Columns

Columns shall be braced to satisfy the requirements applicable to beams classified as moderately ductile members in Section D1.2a.

E6.5. Members

E6.5a. Basic Requirements

Column members shall satisfy the requirements of Section D1.1 for highly ductile members.

E6.5b. Column Flanges

Abrupt changes in column flange area are prohibited in the protected zone as designated in Section E6.5c.

E6.5c. Protected Zones
The region at the base of the column subject to inelastic straining shall be designated as a protected zone, and shall satisfy the requirements of Section D1.3. The length of the protected zone shall be two times the column depth.

E6.6. Connections

E6.6a. Demand Critical Welds

The following welds are demand critical welds, and shall satisfy the requirements of Section A3.4b and I2.3:

(a) Groove welds at column splices
(b) Welds at column-to-base plate connections

E6.6b. Column Bases

Column bases shall be designed in accordance with Section D2.6.
CHAPTER F
BRACED FRAME AND SHEAR WALL SYSTEMS

This chapter provides the basis of design, the requirements for analysis, and the requirements for the system, members and connections for steel braced-frame and shear-wall systems.

The chapter is organized as follows:

F1. Ordinary Concentrically Braced Frames (OCBF)
F2. Special Concentrically Braced Frames (SCBF)
F3. Eccentrically Braced Frames (EBF)
F4. Buckling-Restrained Braced Frames (BRBF)
F5. Special Plate Shear Walls (SPSW)

User Note: The requirements of this chapter are in addition to those required by the Specification and the applicable building code.

F1. ORDINARY CONCENTRICALLY BRACED FRAMES (OCBF)

F1.1. Scope

Ordinary concentrically braced frames (OCBF) of structural steel shall be designed in conformance with this section.

F1.2. Basis of Design

This section is applicable to braced frames that consist of concentrically connected members. Eccentricities less than the beam depth are permitted if they are accounted for in the member design by determination of eccentric moments using the overstrength seismic load. OCBF designed in accordance with these provisions are expected to provide limited inelastic deformation capacity in their members and connections.

F1.3. Analysis

There are no additional analysis requirements.

F1.4. System Requirements

F1.4a. V-Braced and Inverted V-Braced Frames

Beams in V-type and inverted V-type OCBF shall be continuous at brace connections away from the beam-column connection and shall satisfy the following requirements:

(a) The required strength of the beam shall be determined assuming that the braces provide no support of dead and live loads. For load combinations that include earthquake effects, the seismic load effect, E, on the beam shall be determined using the overstrength seismic load in tension, and 0.3Pn in compression, where Pn is the nominal axial strength of the column, kips (N).
(b) As a minimum, one set of lateral braces is required at the point of intersection of the braces, unless the member has sufficient out-of-plane strength and stiffness to ensure stability between adjacent brace points.

**F1.4b. K-Braced Frames**

K-type braced frames shall not be used for OCBF.

**F1.4c. Multi-tiered Braced Frames**

An ordinary concentrically braced frame may be configured as a multi-tiered braced frame (OCBF-MTBF) when the following requirements are met:

1. Braced frames are configured with in-plane struts at each tier level.
2. Columns are torsionally braced at every strut-to-column connection location.

**User Note:** The requirements for torsional bracing are typically satisfied by connecting the strut to the column to restrain torsional movement of the column. The strut must have adequate flexural strength and stiffness and an appropriate connection to the column to perform this function.

3. The required strength of braces for earthquake loads shall be determined from the earthquake load combinations of the applicable building code.
4. The required strength of brace connections shall be determined from the earthquake load combinations of the applicable building code with the connection forces due to the horizontal earthquake load multiplied by a factor of 3.
5. The required axial strength of the struts in the braced frame for earthquake loads shall be determined from the earthquake load combinations of the applicable building code with the axial forces due to the horizontal earthquake loads multiplied by a factor of 3. In tension-compression X-bracing, these forces shall be determined in absence of the compression braces.
6. The required axial strengths of the columns in the braced frame shall be determined from the load combinations of the applicable building code with the forces due to the horizontal earthquake loads multiplied by a factor of 1.5.

**User Note:** Section D1.4 requires columns in OCBF frames to be designed for the overstrength seismic load. Therefore, based upon the above criteria, columns in MTBF-OCBF frames are designed for 1.5 times the overstrength seismic load which is equal to 3 times the earthquake load combinations of the applicable building code.

7. For all load combinations, columns subjected to axial compression shall be designed to resist bending moments due to second-order and geometric imperfection effects. As a minimum, imperfection effects may be represented by an out-of-plane horizontal notional load applied at every tier level and equal to 0.006 times the vertical load contributed by the compression brace connecting the column at the tier level.
(8) When tension-only bracing is used, requirements (3), (4), (5) and (6) need not be satisfied if:

(a) All braces have a maximum slenderness ratio of 200 or more.
(b) The braced frame columns are designed to resist additional in-plane bending moments due to lateral forces determined at every tier level when all braces reach their expected strength in compression or in tension. As a minimum, the lateral force at any tier level shall be equal to 5% of the larger horizontal shear resisted by the braces below and above the tier level. The expected brace strength in tension is \( R_y F_y A_g \) and the expected brace strength in compression may be taken as \( 1.14 P_n \), where

\[
R_y = \text{ratio of the expected yield stress to the specified minimum yield stress, } F_y
\]

### F1.5. Members

#### F1.5a. Basic Requirements

Braces shall satisfy the requirements of Section D1.1 for moderately ductile members.

Exception: Braces in tension-only frames with slenderness ratios greater than 200 need not comply with this requirement.

#### F1.5b. Slenderness

Braces in V or inverted-V configurations shall have

\[
\frac{KL}{r} \leq 4 \sqrt{E/F_y}
\]

where

\[
E = \text{modulus of elasticity of steel, ksi (MPa)}
\]

\[
K = \text{effective length factor}
\]

\[
L = \text{length of brace, in. (mm)}
\]

\[
r = \text{governing radius of gyration, in. (mm)}
\]

### F1.5c. Beams

The required strength of beams and their connections shall be determined using the overstrength seismic load. In seismically isolated structures, OCBF above the isolation system need not satisfy the requirements of Section F1.4a.

### F1.6. Connections
F1.6a. Brace Connections

The required strength of diagonal brace connections shall be determined using the overstrength seismic load.

Exception: The required strength of the brace connection need not exceed the following:

(a) In tension, the expected yield strength, which shall be determined as $R_y F_y A_g$ multiplied by $1/\alpha_s$, where $\alpha_s = LRFD$-ASD force level adjustment factor = 1.0 for LRFD and 1.5 for ASD.

(b) In compression, the expected brace strength in compression multiplied by $1/\alpha_s$, which is permitted to be taken as the lesser of $R_y F_y A_g$ and $1.1 F_{cre} A_g$, where $F_{cre}$ is determined from Specification Chapter E using the equations for $F_{cr}$, except that the expected yield stress $R_y F_y$ is used in lieu of $F_y$. The brace length used for the determination of $F_{cre}$ shall not exceed the distance from brace end to brace end.

(c) When oversized holes are used, the required strength for the limit state of bolt slip need not exceed the seismic load effect based upon the load combinations without overstrength as stipulated by the applicable building code.

F1.7. Ordinary Concentrically Braced Frames above Seismic Isolation Systems

F1.7a. System Requirements

Beams in V-type and inverted V-type braced frames shall be continuous between columns.

F1.7b. Members

Braces shall have a slenderness ratio, $KL/r \leq 4\sqrt{E/F_y}$.

F2. SPECIAL CONCENTRICALLY BRACED FRAMES (SCBF)

F2.1. Scope

Special concentrically braced frames (SCBF) of structural steel shall be designed in conformance with this section. Collector beams that connect SCBF braces shall be considered to be part of the SCBF.

F2.2. Basis of Design

This section is applicable to braced frames that consist of concentrically connected members. Eccentricities less than the beam depth are permitted if the resulting member and connection forces are addressed in the design and do not change the expected source of inelastic deformation capacity.
SCBF designed in accordance with these provisions are expected to provide significant inelastic deformation capacity primarily through brace buckling and yielding of the brace in tension.

F2.3. Analysis

The required strength of columns, beams and connections in SCBF shall be determined using the capacity-limited seismic load effect. The capacity-limited horizontal seismic load effect, $E_{cl}$, shall be taken as the larger force determined from the following two analyses:

(a) An analysis in which all braces are assumed to resist forces corresponding to their expected strength in compression or in tension

(b) An analysis in which all braces in tension are assumed to resist forces corresponding to their expected strength and all braces in compression are assumed to resist their expected post-buckling strength

(c) For multi-tiered braced frames, analyses representing progressive yielding and buckling of the braces from weakest tier to strongest. Analyses shall consider both directions of frame loading.

Braces shall be determined to be in compression or tension neglecting the effects of gravity loads. Analyses shall consider both directions of frame loading.

The expected brace strength in tension is $R_y F_y A_g$, where $A_g$ is the gross area, in.$^2$ (mm$^2$).

The expected brace strength in compression is permitted to be taken as the lesser of $R_y F_y A_g$ and $1/0.877 F_{cr} A_g$ where $F_{cr}$ is determined from Specification Chapter E using the equations for $F_{cr}$, except that the expected yield stress $R_y F_y$ is used in lieu of $F_y$. The brace length used for the determination of $F_{cr}$ shall not exceed the distance from brace end to brace end.

The expected post-buckling brace strength shall be taken as a maximum of 0.3 times the expected brace strength in compression.

User Note: Braces with a slenderness ratio of 200 (the maximum permitted by Section F2.5b) buckle elastically for permissible materials; the value of $0.3 F_{cr}$ for such braces is 2.1 ksi. This value may be used in Section F2.3(b) for braces of any slenderness and a liberal estimate of the required strength of framing members will be obtained. Alternatively, 0 ksi may also be used to simplify the analysis.

Exceptions:

(a) It is permitted to neglect flexural forces resulting from seismic drift in this determination. Moment resulting from a load applied to the column between points of lateral support shall be considered.

(b) The required strength of columns need not exceed the least of the following:

(2) The forces corresponding to the resistance of the foundation to overturning uplift
(3) Forces as determined from nonlinear analysis as defined in Section C3.

(c) The required strength of bracing connections shall be as specified in Section F2.6c.

**User Note:** Exception (c) is only relevant for ASD.

### F2.4. System Requirements

#### F2.4a. Lateral Force Distribution

Along any line of braces, braces shall be deployed in alternate directions such that, for either direction of force parallel to the braces, at least 30% but no more than 70% of the total horizontal force along that line is resisted by braces in tension, unless the available strength of each brace in compression is larger than the required strength resulting from the overstrength seismic load. For the purposes of this provision, a line of braces is defined as a single line or parallel lines with a plan offset of 10% or less of the building dimension perpendicular to the line of braces.

Where opposing diagonal braces along a frame line do not occur in the same bay, the required strengths of the diaphragm, collectors, and elements of the horizontal framing system shall be determined such that the forces resulting from the post-buckling behavior using the analysis requirements of Section F2.3 can be transferred between the braced bays. The required strengths of the collectors shall not be based on a load less than that stipulated by the applicable building code.

#### F2.4b. V- and Inverted V-Braced Frames

Beams that are intersected by braces away from beam-to-column connections shall satisfy the following requirements:

(a) Beams shall be continuous between columns.

(b) Beams shall be braced to satisfy the requirements for moderately ductile members in Section D1.2a.

As a minimum, one set of lateral braces is required at the point of intersection of the V-type (or inverted V-type) braced frames, unless the beam has sufficient out-of-plane strength and stiffness to ensure stability between adjacent brace points.

**User Note:** One method of demonstrating sufficient out-of-plane strength and stiffness of the beam is to apply the bracing force defined in Equation A-6-7 of Appendix 6 of the Specification to each flange so as to form a torsional couple; this loading should be in conjunction with the flexural forces determined from the analysis required by Section F2.3. The stiffness of the beam (and its restraints) with respect to this torsional loading should be sufficient to satisfy Equation A-6-8 of the Specification.

#### F2.4c. K-Braced Frames

K-type braced frames shall not be used for SCBF.
F2.4d. Tension-Only Frames

Tension-only frames shall not be used in SCBF.

**User Note:** Tension-only braced frames are those in which the brace compression resistance is neglected in the design and the braces are designed for tension forces only.

F2.4e. Multi-tiered Braced Frames

Braces shall be used in symmetrical pairs at every tier level.

Struts shall satisfy the following requirements:

1. Horizontal struts shall be provided at every tier level.
2. Struts shall satisfy the minimum strength requirements specified for beams in Section F2.3.
3. Struts shall resist shear forces and bending moments induced by braces buckling in compression.
4. Struts that are intersected by braces away from strut-to-column connections shall also meet the requirements of Section F2.4b. When brace buckling occurs out-of-plane, torsional moments arising from brace buckling shall be considered when verifying lateral bracing or minimum out-of-plane strength and stiffness requirements. The torsional moments shall correspond to \( 1.1 R_y M_p \) of the brace about the critical buckling axis, but need not exceed forces corresponding to the flexural resistance of the brace connection, where \( M_p \) is the nominal plastic flexural strength, kip-in. (N-mm).

Columns shall satisfy the following requirements:

1. Columns shall be restrained against rotation about their longitudinal axis at each tier level.

**User Note:** The requirements for torsional bracing are typically satisfied by the horizontal (out-of-plane) flexural stiffness and strength of the strut at each tier level.

2. Columns shall have sufficient strength to resist forces arising from brace buckling. These forces shall correspond to \( 1.1 R_y M_p \) of the brace about the critical buckling axis, but need not exceed forces corresponding to the flexural resistance of the brace connections.

3. For all load combinations, columns subjected to axial compression shall be designed to resist bending moments due to second-order and geometric imperfection effects. As a minimum, imperfection effects may be represented by an out-of-plane horizontal notional load applied at every tier level and equal to 0.006 times the vertical load contributed by the compression brace intersecting the column at the tier level. In all cases, the multiplier \( B_1 \) as defined in Appendix 8 of the Specification shall not exceed 2.0.

Each tier shall be subject to the drift limitations of the applicable building code, but not...
larger than 2% of the tier height.

**F2.5. Members**

**F2.5a. Basic Requirements**

Columns, beams, and braces shall satisfy the requirements of Section D1.1 for highly ductile members. Struts in SCBF-MTBF shall satisfy the requirements of Section D1.1 for moderately ductile members.

**F2.5b. Diagonal Braces**

Braces shall comply with the following requirements:

(a) Slenderness: Braces shall have a slenderness ratio, $KL/r \leq 200$.

(b) Built-up Braces: The spacing of connectors shall be such that the slenderness ratio, $a/r_i$, of individual elements between the connectors does not exceed 0.4 times the governing slenderness ratio of the built-up member.

The sum of the available shear strengths of the connectors shall equal or exceed the available tensile strength of each element. The spacing of connectors shall be uniform. Not less than two connectors shall be used in a built-up member. Connectors shall not be located within the middle one-fourth of the clear brace length.

Exception: Where the buckling of braces about their critical bucking axis does not cause shear in the connectors, the design of connectors need not comply with this provision.

(c) The brace effective net area shall not be less than the brace gross area. Where reinforcement on braces is used the following requirements shall apply:

1. The specified minimum yield strength of the reinforcement shall be at least the specified minimum yield strength of the brace.

2. The connections of the reinforcement to the brace shall have sufficient strength to develop the expected reinforcement strength on each side of a reduced section.

**F2.5c. Protected Zones**

The protected zone of SCBF shall satisfy Section D1.3 and include the following:

(a) For braces, the center one-quarter of the brace length and a zone adjacent to each connection equal to the brace depth in the plane of buckling.
F2.6. Connections

F2.6a. Demand Critical Welds

The following welds are demand critical welds, and shall satisfy the requirements of Section A3.4b and I2.3:

(a) Groove welds at column splices

(b) Welds at column-to-base plate connections

Exception: Where it can be shown that column hinging at, or near, the base plate is precluded by conditions of restraint, and in the absence of net tension determined using the overstrength seismic load, demand critical welds are not required.

(c) Welds at beam-to-column connections conforming to Section F2.6b(c)

F2.6b. Beam-to-Column Connections

Where a brace or gusset plate connects to both members at a beam-to-column connection, the connection shall conform to one of the following:

(a) The connection assembly shall be a simple connection meeting the requirements of Specification Section B3.4a where the required rotation is taken to be 0.025 rad; or

(b) The connection assembly shall be designed to resist a moment equal to the lesser of

\[ M = \min \left( R_y M_p, \sum R_y F_y Z \right) \times 1.1 \frac{1}{\alpha_s} \]

This moment shall be considered in combination with the required strength of the brace connection and beam connection, including the the diaphragm collector forces determined using the overstrength seismic load.

(c) The beam-to-column connection shall meet the requirements of Section E1.6b(c).

F2.6c. Brace Connections

The required strength in tension, compression and flexure of brace connections (including beam-to-column connections if part of the braced-frame system) shall be determined as required below. These required strengths are permitted to be considered independently.
without interaction.

1. **Required Tensile Strength**

   The required tensile strength is the lesser of the following:

   (a) The expected yield strength in tension, of the brace, determined as $R_y F_y A_g$, divided by $\alpha_s$.

   **Exception:**

   Braces need not comply with the requirements of Equation J4-1 and J4-2 of the *Specification* for this loading.

   **User Note:** This exception applies to braces where the section is reduced or where the net section is effectively reduced due to shear lag. A typical case is a slotted HSS brace at the gusset plate connection. Section F2.5b requires braces with holes or slots to be reinforced such that the effective net area exceeds the gross area.

   The brace strength used to check connection limit states, such as brace block shear, may be determined using expected material properties as permitted by Section A3.2.

   (b) The maximum load effect, indicated by analysis, that can be transferred to the brace by the system.

   When oversized holes are used, the required strength for the limit state of bolt slip need not exceed the seismic load effect determined using the overstrength seismic loads.

   **User Note:** For other limit states the loadings of (a) and (b) apply.

2. **Required Compressive Strength**

   Brace connections shall be designed for a required compressive strength based on buckling limit states that is at least equal to $1/\alpha_s$ times the expected brace strength in compression, where the expected brace strength in compression is as defined in Section F2.3.

3. **Accommodation of Brace Buckling**

   Brace connections shall be designed to withstand the flexural forces or rotations imposed by brace buckling. Connections satisfying either of the following provisions are deemed to satisfy this requirement:

   (a) Required Flexural Strength: Brace connections designed to withstand the flexural forces imposed by brace buckling shall have a required flexural strength equal to the expected brace flexural strength multiplied by $1.1/\alpha_s$. 

Seismic Provisions for Structural Steel Buildings
PUBLIC REVIEW Draft Dated March 16, 2015
AMERICAN INSTITUTE OF STEEL CONSTRUCTION
The expected brace flexural strength shall be determined as \( R_y M_p \) of the brace about the critical buckling axis.

(b) Rotation Capacity: Brace connections designed to withstand the rotations imposed by brace buckling shall have sufficient rotation capacity to accommodate the required rotation at the design story drift. Inelastic rotation of the connection is permitted.

**User Note:** Accommodation of inelastic rotation is typically accomplished by means of a single gusset plate with the brace terminating before the line of restraint. The detailing requirements for such a connection are described in the Commentary.

4. **Gusset Plates**

For out-of-plane brace buckling, welds that are part of a connection assembly attaching a gusset plate to the surrounding frame members shall have available strength equal to \( R_y F_y A_p / \alpha_s \) times the joint length.

**User Note:** The expected strength of the gusset plate in tension may be developed using groove welds or double-sided fillet welds of a size equal to or larger than 5/8 times the gusset plate thickness.

For the limit state of block shear rupture in concentrically loaded gusset plates, the available strength shall be taken as:

\[
R_n = 0.60 \left( \frac{F_y + F_u}{2} A_{gv} + F_u A_{nt} \right) \tag{F2-1}
\]

\[
\phi = 0.90 \quad \Omega = 1.67
\]

where

\( A_{gv} = \text{gross area subject to shear, in.}^2 \text{ (mm}^2) \)

\( A_{nt} = \text{net area subject to tension, in.}^2 \text{ (mm}^2) \)

F2.6d. **Column Splices**

Column splices shall comply with the requirements of Section D2.5. Where groove welds are used to make the splice, they shall be complete-joint-penetration groove welds. Column splices shall be designed to develop at least 50\% of the lesser plastic flexural strength, \( M_p \), of the connected members, divided by \( \alpha_s \).

The required shear strength shall be \( (\Sigma M_p / \alpha_s) / H_c \)

where

\( H_c = \text{clear height of the column between beam connections, including a structural slab, if present, in. (mm)} \)
\[ \Sigma M_p = \text{sum of the plastic flexural strengths, } F_y Z, \text{ of the top and bottom ends of the column, kip-in. (N-mm)} \]

F3. ECCENTRICALLY BRACED FRAMES (EBF)

F3.1. Scope

Eccentrically braced frames (EBF) of structural steel shall be designed in conformance with this section.

F3.2. Basis of Design

This section is applicable to braced frames for which one end of each brace intersects a beam at an eccentricity from the intersection of the centerlines of the beam and an adjacent brace or column, forming a link that is subject to shear and flexure. Eccentricities less than the beam depth are permitted in the brace connection away from the link if the resulting member and connection forces are addressed in the design and do not change the expected source of inelastic deformation capacity.

EBF designed in accordance with these provisions are expected to provide significant inelastic deformation capacity primarily through shear or flexural yielding in the links.

Where links connect directly to columns, design of their connections to columns shall provide the performance required by Section F3.6e.1 and demonstrate this conformance as required by Section F3.6e.2.

F3.3. Analysis

The required strength of diagonal braces and their connections, beams outside links, and columns shall be determined using the capacity-limited seismic load effect. The capacity-limited horizontal seismic load effect, \( E_{cl} \), shall be taken as the forces developed in the member assuming the forces at the ends of the links correspond to the adjusted link shear strength. The adjusted link shear strength shall be taken as \( R_y \) times the link nominal shear strength, \( V_n \), given in Section F3.5b.2 multiplied by 1.25 for I-shaped links and 1.4 for box links.

Exceptions:

(a) The effect of capacity-limited horizontal forces, \( E_{cl} \), is permitted to be taken as 0.88 times the forces determined in Section F3.3 for the design of the portions of beams outside links.

(b) It is permitted to neglect flexural forces resulting from seismic drift in this determination. Moment resulting from a load applied to the column between points of lateral support must be considered.
The required strength of columns need not exceed the lesser of the following:

1. Forces corresponding to the resistance of the foundation to overturning uplift
2. Forces as determined from nonlinear analysis as defined in Section C.3.

The inelastic link rotation angle shall be determined from the inelastic portion of the design story drift. Alternatively, the inelastic link rotation angle is permitted to be determined from nonlinear analysis as defined in Section C.3.

**User Note:** The seismic load effect, , used in the design of EBF members, such as the required axial strength used in the equations in Section F.3.5, should be calculated from the analysis above.

### F.3.4. System Requirements

#### F.3.4a. Link Rotation Angle

The link rotation angle is the inelastic angle between the link and the beam outside of the link when the total story drift is equal to the design story drift, . The link rotation angle shall not exceed the following values:

(a) For links of length \(1.6 \frac{M_p}{V_p}\) or less: 0.08 rad
(b) For links of length \(2.6 \frac{M_p}{V_p}\) or greater: 0.02 rad

where

\[
\begin{align*}
M_p &= \text{plastic flexural strength of a link, kip-in. (N-mm)} \\
V_p &= \text{plastic shear strength of a link, kips (N)}
\end{align*}
\]

Linear interpolation between the above values shall be used for links of length between \(1.6 \frac{M_p}{V_p}\) and \(2.6 \frac{M_p}{V_p}\).

#### F.3.4b. Bracing of Link

Bracing shall be provided at both the top and bottom link flanges at the ends of the link for I-shaped sections. Bracing shall have an available strength and stiffness as required for expected plastic hinge locations by Section D.1.2c.

### F.3.5. Members

#### F.3.5a. Basic Requirements

Brace members shall satisfy width-to-thickness limitations in Section D.1.1 for moderately ductile members.

Column members shall satisfy width-to-thickness limitations in Section D.1.1 for highly ductile members.
Where the beam outside of the link is a different section from the link, the beam shall satisfy the width-to-thickness limitations in Section D1.1 for moderately ductile members.

**User Note:** The diagonal brace and beam segment outside of the link are intended to remain essentially elastic under the forces generated by the fully yielded and strain hardened link. Both the diagonal brace and beam segment outside of the link are typically subject to a combination of large axial force and bending moment, and therefore should be treated as beam-columns in design, where the available strength is defined by Chapter H of the Specification.

Where the beam outside the link is the same member as the link, its strength may be determined using expected material properties as permitted by Section A3.2.

**F3.5b. Links**

Links subject to shear and flexure due to eccentricity between the intersections of brace centerlines and the beam centerline (or between the intersection of the brace and beam centerlines and the column centerline for links attached to columns) shall be provided. The link shall be considered to extend from brace connection to brace connection for center links and from brace connection to column face for link-to-column connections except as permitted by Section F3.6e.

1. **Limitations**

Links shall be I-shaped cross sections (rolled wide-flange sections or built-up sections), or built-up box sections. HSS sections shall not be used as links.

Links shall satisfy the requirements of Section D1.1 for highly ductile members.

Exceptions: Flanges of links with I-shaped sections with link lengths, \( e \leq 1.6 \frac{M_p}{V_p} \), are permitted to satisfy the requirements for moderately ductile members. Flanges of links with box sections are permitted to satisfy the requirements for moderately ductile members. Webs of links with box sections with link lengths, \( e \leq 1.6 \frac{M_p}{V_p} \), are permitted to satisfy the requirements for moderately ductile members.

The web or webs of a link shall be single thickness. Doubler-plate reinforcement and web penetrations are not permitted.

For links made of built-up cross sections, complete-joint-penetration groove welds shall be used to connect the web (or webs) to the flanges.

Links of built-up box sections shall have a moment of inertia, \( I_y \), about an axis in the plane of the EBF limited to \( I_y > 0.67I_x \), where \( I_x \) is the moment of inertia about an axis perpendicular to the plane of the EBF.

2. **Shear Strength**
The link design shear strength, $\phi_v V_n$, and the allowable shear strength, $V_p/\Omega_v$, shall be the lower value obtained in accordance with the limit states of shear yielding in the web and flexural yielding in the gross section. For both limit states:

$$\phi_v = 0.90 \text{ (LRFD)} \quad \Omega_v = 1.67 \text{ (ASD)}$$

(a) For shear yielding:

$$V_n = V_p$$

where

$$V_p = 0.6 F_y A_{lw} \text{ for } \alpha_s P_r / P_y \leq 0.15$$

$$V_p = 0.6 F_y A_{lw} \sqrt{1 - \left(\alpha_s P_r / P_y\right)^2} \text{ for } \alpha_s P_r / P_y > 0.15$$

$$A_{lw} = (d-2t_l) t_w \text{ for I-shaped link sections}$$

$$A_{lw} = 2(d-2t_l) t_w \text{ for box link sections}$$

$$P_r = P_u \text{ (LRFD) or } P_a \text{ (ASD), as applicable}$$

$$P_u = \text{required axial strength using LRFD load combinations, kips (N)}$$

$$P_a = \text{required axial strength using ASD load combinations, kips (N)}$$

$$P_y = \text{nominal axial yield strength} = F_y A_g$$

(b) For flexural yielding:

$$V_n = 2M_p/e$$

where

$$M_p = F_x Z \text{ for } \alpha_s P_r / P_y \leq 0.15$$

$$M_p = F_x Z \left(1 - \frac{\alpha_s P_r / P_y}{0.85}\right) \text{ for } \alpha_s P_r / P_y > 0.15$$

$$e = \text{length of link, defined as the clear distance between the ends of two diagonal braces or between the diagonal brace and the column face, in. (mm)}$$

3. Link Length

If $P_r / P_c > 0.15$, the length of the link shall be limited as follows:

When $\rho' \leq 0.5$

$$e \leq \frac{1.6 M_p}{V_p}$$

When $\rho' > 0.5$
\[ e \leq \frac{1.6M_p}{V_p}(1.15 - 0.3\rho') \]  
\[(F3-11)\]

where

\[ \rho' = \frac{P_r}{V_y} \]  
\[(F3-12)\]

\[ V_r = V_{u} \text{ (LRFD)} \text{ or } V_{a} \text{ (ASD)}, \text{ as applicable} \text{, kips (N)} \]
\[ V_u = \text{required shear strength based on LRFD load combinations, kips (N)} \]
\[ V_a = \text{required shear strength based on ASD load combinations, kips (N)} \]
\[ V_y = \text{nominal shear yield strength, kips (N)} \]
\[ = 0.6F_{yAlw} \]  
\[(F3-13)\]

User Note: For links with low axial force there is no upper limit on link length. The limitations on link rotation angle in Section F3.4a result in a practical lower limit on link length.

4. Link Stiffeners for I-Shaped Cross Sections

Full-depth web stiffeners shall be provided on both sides of the link web at the diagonal brace ends of the link. These stiffeners shall have a combined width not less than \((b_f - 2t_w)\) and a thickness not less than the larger of \(0.75t_w\) or \(3/8\) in. (10 mm), where \(b_f\) and \(t_w\) are the link flange width and link web thickness, respectively.

Links shall be provided with intermediate web stiffeners as follows:

(a) Links of lengths \(1.6M_p/V_p\) or less shall be provided with intermediate web stiffeners spaced at intervals not exceeding \((30t_w-d/5)\) for a link rotation angle of 0.08 rad or \((52t_w-d/5)\) for link rotation angles of 0.02 rad or less. Linear interpolation shall be used for values between 0.08 and 0.02 rad.

(b) Links of length greater than or equal to \(2.6M_p/V_p\) and less than \(5M_p/V_p\) shall be provided with intermediate web stiffeners placed at a distance of 1.5 times \(b_f\) from each end of the link.

(c) Links of length between \(1.6M_p/V_p\) and \(2.6M_p/V_p\) shall be provided with intermediate web stiffeners meeting the requirements of (a) and (b) above.

Intermediate web stiffeners are not required in links of length greater than \(5M_p/V_p\).

Intermediate web stiffeners shall be full depth. For links that are less than 25 in. (635 mm) in depth, stiffeners are required on only one side of the link web. The thickness of one-sided stiffeners shall not be less than \(t_w\) or \(3/8\) in. (10 mm), whichever is larger, and the width shall be not less than \((b_f/2) - t_w\). For links that are 25 in. (635 mm) or larger, full-depth stiffeners shall be provided on both sides of the link.
mm) in depth or greater, intermediate stiffeners with these dimensions are required on both sides of the web.

The required strength of fillet welds connecting a link stiffener to the link web is $F_y A_s / \alpha_s$, where $A_s$ is the horizontal cross-sectional area of the link stiffener and $F_y$ is the yield stress of the stiffener. The required strength of fillet welds connecting the stiffener to the link flanges is $F_y A_s / (4\alpha_s)$.

5. **Link Stiffeners for Box Sections**

Full-depth web stiffeners shall be provided on one side of each link web at the diagonal brace connection. These stiffeners are permitted to be welded to the outside or inside face of the link webs. These stiffeners shall each have a width not less than $b/2$, where $b$ is the inside width of the box. These stiffeners shall each have a thickness not less than the larger of $0.75 t_w$ or $\frac{1}{2}$ in. (13 mm).

Box links shall be provided with intermediate web stiffeners as follows:

(a) For links of length $1.6 M_p / V_p$ or less and with web depth-to-thickness ratio, $h/t_w$, greater than or equal to $0.67 \sqrt{\frac{E}{R_y F_y}}$, full-depth web stiffeners shall be provided on one side of each link web, spaced at intervals not exceeding $20 t_w - (d - 2 t_f) / 8$.

(b) For links of length $1.6 M_p / V_p$ or less and with web depth-to-thickness ratio, $h/t_w$, less than $0.67 \sqrt{\frac{E}{R_y F_y}}$, no intermediate web stiffeners are required.

(c) For links of length greater than $1.6 M_p / V_p$, no intermediate web stiffeners are required.

Intermediate web stiffeners shall be full depth, and are permitted to be welded to the outside or inside face of the link webs.

The required strength of fillet welds connecting a link stiffener to the link web is $F_y A_s / \alpha_s$, where $A_s$ is the horizontal cross-sectional area of the link stiffener.

**User Note:** Stiffeners of box links need not be welded to link flanges.

F3.5c. **Protected Zones**

Links in EBFs are a protected zone, and shall satisfy the requirements of Section D1.3.

F3.6. **Connections**
F3.6a. Demand Critical Welds

The following welds are demand critical welds and shall satisfy the requirements of Sections A3.4b and I2.3:

(a) Groove welds at column splices

(b) Welds at column-to-base plate connections

Exception: Where it can be shown that column hinging at, or near, the base plate is precluded by conditions of restraint, and in the absence of net tension determined using the overstrength seismic load, demand critical welds are not required.

(c) Welds at beam-to-column connections conforming to Section F3.6b(c)

(d) Where links connect to columns, welds attaching the link flanges and the link web to the column (e) In built-up beams, welds within the link connecting the webs to the flanges

F3.6b. Beam-to-Column Connections

Where a brace or gusset plate connects to both members at a beam-to-column connection, the connection shall conform to one of the following:

(a) The connection assembly is a simple connection meeting the requirements of Specification Section B3.4a where the required rotation is taken to be 0.025 rad; or

(b) The connection assembly is designed to resist a moment equal to the lesser of the following:

1. A moment corresponding to the expected beam flexural strength, \( R_y M_p \), times 1.1/\( \alpha_s \)

2. A moment corresponding to the sum of the expected column flexural strengths, \( \Sigma \left( R_y F_r Z \right) \), times 1.1/\( \alpha_s \)

This moment shall be considered in combination with the required strength of the brace connection and beam connection, including the diaphragm collector forces determined using the overstrength seismic load.

(c) The beam-to-column connection meets the requirements of Section E1.6b(c).

F3.6c. Brace Connections

When oversized holes are used, the required strength for the limit state of bolt slip need not exceed the seismic load effect determined using the overstrength seismic load.
Connections of braces designed to resist a portion of the link end moment shall be designed as fully restrained.

**F3.6d. Column Splices**

Column splices shall comply with the requirements of Section D2.5. Where groove welds are used to make the splice, they shall be complete-joint-penetration groove welds. Column splices shall be designed to develop at least 50% of the lesser plastic flexural strength, \( M_p \), of the connected members, divided by \( \alpha \).

The required shear strength shall be \( \Sigma M_p / (\alpha H_c) \),

where

\[ H_c = \text{clear height of the column between beam connections, including a structural slab, if present, in. (mm)} \]

\[ \Sigma M_p = \text{sum of the plastic flexural strengths, } F_yZ, \text{ at the top and bottom ends of the column, kip-in. (N-mm)} \]

**F3.6e. Link-to-Column Connections**

1. **Requirements**

   Link-to-column connections shall be fully restrained (FR) moment connections and shall satisfy the following requirements:

   (a) The connection shall be capable of sustaining the link rotation angle specified in Section F3.4a.

   (b) The shear resistance of the connection, measured at the required link rotation angle, shall be at least equal to the expected shear strength of the link, \( R_y V_n \), as defined in Section F3.5b.2.

   (c) The flexural resistance of the connection, measured at the required link rotation angle, shall be at least equal to the moment corresponding to the nominal shear strength of the link, \( V_n \), as defined in Section F3.5b.2.

2. **Conformance Demonstration**

   Link-to-column connections shall satisfy the above requirements by one of the following:

   (a) Use a connection prequalified for EBF in accordance with Section K1.

   **User Note:** There are no prequalified link-to-column connections.
(b) Provide qualifying cyclic test results in accordance with Section K2. Results of at least two cyclic connection tests shall be provided and are permitted to be based on one of the following:

(1) Tests reported in research literature or documented tests performed for other projects that are representative of project conditions, within the limits specified in Section K2.

(2) Tests that are conducted specifically for the project and are representative of project member sizes, material strengths, connection configurations, and matching connection material properties, within the limits specified in Section K2.

Exception: Cyclic testing of the connection is not required if the following conditions are met:

(a) Reinforcement at the beam-to-column connection at the link end precludes yielding of the beam over the reinforced length.

(b) The available strength of the reinforced section and the connection equals or exceeds the required strength calculated based upon adjusted link shear strength as described in Section F3.3.

(c) The link length (taken as the beam segment from the end of the reinforcement to the brace connection) does not exceed $1.6M_p/V_p$.

(d) Full depth stiffeners as required in Section F3.5b.4 are placed at the link-to-reinforcement interface.

F4. BUCKLING-RESTRAINED BRACED FRAMES (BRBF)

F4.1. Scope

Buckling-restrained braced frames (BRBF) of structural steel shall be designed in conformance with this section.

F4.2. Basis of Design

This section is applicable to frames with specially fabricated braces concentrically connected to beams and columns. Eccentricities less than the beam depth are permitted if the resulting member and connection forces are addressed in the design and do not change the expected source of inelastic deformation capacity.

BRBF designed in accordance with these provisions are expected to provide significant inelastic deformation capacity primarily through brace yielding in tension and compression. Design of braces shall provide the performance required by Sections F4.5b.1 and F4.5b.2, and demonstrate this conformance as required by Section F4.5b.3. Braces shall be designed, tested and detailed to accommodate expected deformations. Expected deformations are those corresponding to a story drift of at least 2% of the story height or two times the design story drift, whichever is larger, in addition to brace deformations resulting from deformation of the frame due to gravity loading.
BRBF shall be designed so that inelastic deformations under the design earthquake will occur primarily as brace yielding in tension and compression.

**F4.2a. Brace Strength**

The adjusted brace strength shall be established on the basis of testing as described in this section.

Where required by these Provisions, brace connections and adjoining members shall be designed to resist forces calculated based on the adjusted brace strength.

The adjusted brace strength in compression shall be \( \beta \omega R_y P_{yse} \),

where

- \( \beta \) = compression strength adjustment factor
- \( \omega \) = strain hardening adjustment factor
- \( P_{yse} \) = axial yield strength of steel core, ksi (MPa)

The adjusted brace strength in tension shall be \( \omega R_y P_{yse} \).

Exception: The factor \( R_y \) need not be applied if \( P_{yse} \) is established using yield stress determined from a coupon test.

**F4.2b. Adjustment Factors**

Adjustment factors shall be determined as follows:

The compression strength adjustment factor, \( \beta \), shall be calculated as the ratio of the maximum compression force to the maximum tension force of the test specimen measured from the qualification tests specified in Section K3.4c at strains corresponding to the expected deformations adjusted by the yield to length factor indicated below. The larger value of \( \beta \) from the two required brace qualification tests shall be used. In no case shall \( \beta \) be taken as less than 1.0.

The strain hardening adjustment factor, \( \omega \), shall be calculated as the ratio of the maximum tension force measured from the qualification tests specified in Section K3.4c at strains corresponding to the expected deformations to the measured yield force, \( P_{yse} \), of the test specimen adjusted by the yield to length factor indicated below.

The yield-to-length factor used in the determination of \( \beta \) and \( \omega \) shall be determined as follows:

- (a) a factor of 0.9 for braces with a yield length ratio of 0.4 or greater
- (b) for braces with a yield length ratio less than 0.4, a factor equal to 1.6 minus 1.75 times the yield length ratio.
In no case shall the product of \( \beta \) and this factor be taken less than 1.05, nor shall the product of \( \omega \) and this factor be taken less than 1.25. Neither \( \beta \) nor \( \omega \) shall be taken as less than that determined at twice the design story drift (not including the minimum drift defined in Section F4.2).

The yield length ratio is the ratio of the length over which the core area is equal to \( A_{sc} \) to the length from intersection of work points at each end of the brace.

The expected brace deformation shall be determined from the story drift specified in Section F4.2 and shall include the effects of beam vertical flexibility. Alternatively, the brace expected deformation is permitted to be determined from nonlinear analysis as defined in Section C3, where the brace deformation is considered a critical deformation-controlled action.

**F4.2c. Brace Deformations**

The expected brace deformation shall be determined from the story drift specified in Section F4.2 and shall include the effects of beam vertical flexibility. Alternatively, the brace deformation is permitted to be determined from nonlinear analysis as defined in Section C3.

**F4.3. Analysis**

The required strength of columns, beams and connections in BRBF shall be determined using the capacity-limited seismic load effect. The capacity-limited horizontal seismic load effect, \( E_{cl} \), shall be taken as the forces developed in the member assuming the forces in all braces correspond to their adjusted strength in compression or in tension.

Braces shall be determined to be in compression or tension neglecting the effects of gravity loads. Analyses shall consider both directions of frame loading.

The adjusted brace strength in tension shall be as given in Section F4.2a.

**Exceptions:**

(a) It is permitted to neglect flexural forces resulting from seismic drift in this determination. Moment resulting from a load applied to the column between points of lateral support, including Section F4.4d loads, must be considered.

(b) The required strength of columns need not exceed the lesser of the following:

1. The forces corresponding to the resistance of the foundation to overturning uplift. Section F4.4d in-plane column load requirements shall be adhered to.

2. Forces as determined from nonlinear analysis as defined in Section C3.

**F4.4. System Requirements**

**F4.4a. V- and Inverted V-Braced Frames**
V-type and inverted-V-type braced frames shall satisfy the following requirements:

(a) The required strength of beams intersected by braces, their connections and supporting members shall be determined based on the load combinations of the applicable building code assuming that the braces provide no support for dead and live loads. For load combinations that include earthquake effects, the vertical and horizontal earthquake effect, $E$, on the beam shall be determined from the adjusted brace strengths in tension and compression.

(b) Beams shall be continuous between columns. Beams shall be braced to satisfy the requirements for moderately ductile members in Section D1.2a.1.

As a minimum, one set of lateral braces is required at the point of intersection of the V-type (or inverted V-type) braces, unless the beam has sufficient out-of-plane strength and stiffness to ensure stability between adjacent brace points.

User Note: The beam has sufficient out-of-plane strength and stiffness if the beam bent in the horizontal plane meets the required brace strength and required brace stiffness for column nodal bracing as prescribed in the Specification. $P_u$ may be taken as the required compressive strength of the brace.

For purposes of brace design and testing, the calculated maximum deformation of braces shall be increased by including the effect of the vertical deflection of the beam under the loading defined in Section F4.4a(a).

F4.4b. K-Braced Frames

K-type braced frames shall not be used for BRBF.

F4.4c Lateral Force Distribution

Where the compression strength adjustment factor, $\beta$, as determined in Section F4.2b exceeds 1.3, the lateral force distribution shall comply with the following:

Along any line of braces, braces shall be deployed in alternate directions such that, for either direction of force parallel to the braces, at least 30% but no more than 70% of the total horizontal force along that line is resisted by braces in tension, unless the available strength of each brace is larger than the required strength resulting from the overstrength seismic load. For the purposes of this provision, a line of braces is defined as a single line or parallel lines with a plan offset of 10% or less of the building dimension perpendicular to the line of braces.

F4.4d. Multi-tiered Braced Frames

Each tier shall be subject to the drift limitations of the applicable building code, but not larger than 2% of the tier height.

The effects of out-of-plane forces due to the mass of the structure and supported items as required by the applicable building code shall be combined with the forces obtained from the...
analyses required by Section F4.3.

Struts shall satisfy the following requirements:

1. In-plane struts shall be provided at every brace to column connection location.
2. Struts shall satisfy the minimum strength requirements specified for beams in Section F4.3.
3. Struts that are intersected by braces away from strut-to-column connections shall also meet the additional requirements of Section F4.4a.

Columns shall satisfy the following requirements:

1. Columns or columnar systems of multi-tiered braced frames shall be designed as simply supported for the height of the frame and shall satisfy the greater of the following in-plane load requirements at each tier:

   a. In-plane loads induced by the summation of frame shears from adjusted brace strengths between adjacent tiers from Section F4.3 analysis, combined with a notional load equal to the material variability notional load factor \( N_{MV} \) times the adjusted brace strength frame shear of the lower strength adjacent tier. Notional loads shall be additive to the unbalanced adjusted brace strength loads or applied to create the greatest load effect on the columns.

\[
N_{MV} = \left(1 - \frac{P_{yse-min}}{P_{yse-max}}\right)
\]

where

\[
P_{yse-max} = \text{maximum specified axial yield strength of steel core, ksi (MPa)}
\]

\[
P_{yse-min} = \text{minimum specified axial yield strength of steel core, ksi (MPa)}
\]

User Note: Specifying the BRB braces using the desired brace capacity, \( P_{yse} \), rather than a desired core area is recommended for the multi-tiered buckling-restrained braced (BRB) frame to eliminate the \( N_{MV} \) factor and allow for the design of equal or nearly equal tier capacities.

b. A minimum notional load equal to 0.5% times the adjusted braced strength frame shear of the higher strength adjacent tier.

2. Columns shall be restrained against rotation about their longitudinal axis at each tier level.

User Note: The requirements for torsional bracing are typically satisfied by connecting the strut to the column to restrain torsional movement of the column. The
strut must have adequate flexural strength and stiffness and have an appropriate
connection to the column to perform this function.

F4.5. Members

F4.5a. Basic Requirements

Beams and columns shall satisfy the requirements of Section D1.1 for moderately ductile
members.

F4.5b. Diagonal Braces

1. Assembly

Braces shall be composed of a structural steel core and a system that restrains the steel core
from buckling.

(a) Steel Core

Plates used in the steel core that are 2 in. (50 mm) thick or greater shall satisfy the minimum
notch toughness requirements of Section A3.3. Splices in the steel core are not permitted.

(b) Buckling-Restraining System

The buckling-restraining system shall consist of the casing for the steel core. In stability
calculations, beams, columns and gussets connecting the core shall be considered parts of
this system.

The buckling-restraining system shall limit local and overall buckling of the steel core for the
expected deformations.

User Note: Conformance to this provision is demonstrated by means of testing as described
in Section F4.5b.3.

2. Available Strength

The steel core shall be designed to resist the entire axial force in the brace.

The brace design axial strength, $P_{yse}$ (LRFD), and the brace allowable axial strength, $P_{yse}/\Omega$
(ASD), in tension and compression, in accordance with the limit state of yielding, shall be
determined as follows:

$$P_{yse} = F_{yse} A_{sc} \quad \text{(F4-1)}$$

$$\phi = 0.90 \text{ (LRFD)} \quad \Omega = 1.67 \text{ (ASD)}$$

where

$$A_{sc} = \text{cross-sectional area of the yielding segment of the steel core, in}^2 \text{ (mm}^2)$$
\[ F_{yse} = \text{specified minimum yield stress of the steel core, or actual yield stress of the steel core as determined from a coupon test, ksi (MPa)} \]

**User Note:** Load effects calculated based on adjusted brace strengths should not be based upon the overstrength seismic load.

### 3. Conformance Demonstration

The design of braces shall be based upon results from qualifying cyclic tests in accordance with the procedures and acceptance criteria of Section K3. Qualifying test results shall consist of at least two successful cyclic tests: one is required to be a test of a brace subassemblage that includes brace connection rotational demands complying with Section K3.2 and the other shall be either a uniaxial or a subassemblage test complying with Section K3.3. Both test types shall be based upon one of the following:

(a) Tests reported in research or documented tests performed for other projects

(b) Tests that are conducted specifically for the project

Interpolation or extrapolation of test results for different member sizes shall be justified by rational analysis that demonstrates stress distributions and magnitudes of internal strains consistent with or less severe than the tested assemblies and that addresses the adverse effects of variations in material properties. Extrapolation of test results shall be based upon similar combinations of steel core and buckling-restraining system sizes. Tests are permitted to qualify a design when the provisions of Section K3 are met.

### F4.5c. Protected Zones

The protected zone shall include the steel core of braces and elements that connect the steel core to beams and columns, and shall satisfy the requirements of Section D1.3.

### F4.6. Connections

#### F4.6a. Demand Critical Welds

The following welds are demand critical welds, and shall satisfy the requirements of Section A3.4b and I2.3:

(a) Groove welds at column splices

(b) Welds at the column-to-base plate connections

Exception: Where it can be shown that column hinging at, or near, the base plate is precluded by conditions of restraint, and in the absence of net tension determined using the overstrength seismic load, demand critical welds are not required.

(c) Welds at beam-to-column connections conforming to Section F4.6b(c)
F4.6b. Beam-to-Column Connections

Where a brace or gusset plate connects to both members at a beam-to-column connection, the connection shall conform to one of the following:

(a) The connection assembly shall be a simple connection meeting the requirements of Specification Section B3.4a where the required rotation is taken to be 0.025 rad; or

(b) The connection assembly shall be designed to resist a moment equal to the lesser of the following:

1. A moment corresponding to the expected beam flexural strength, \( R_y M_p \) times 1.1/\( \alpha_s \).
2. A moment corresponding to the sum of the expected column flexural strengths, \( \sum (R_y F_y Z) \) times 1.1/\( \alpha_s \), where
   \[ Z = \text{plastic section modulus about the axis of bending, in.}^3 \text{ (mm}^3) \]
   This moment shall be considered in combination with the required strength of the brace connection and beam connection, including the diaphragm collector forces determined using the overstrength seismic load.

(c) The beam-to-column connection shall meet the requirements of Section E1.6b(c).

F4.6c. Diagonal Brace Connections

1. Required Strength

The required strength of brace connections in tension and compression (including beam-to-column connections if part of the braced-frame system) shall be the adjusted brace strength divided by \( \alpha_s \), where the adjusted brace strength is as defined in Section F4.2a.

When oversized holes are used, the required strength for the limit state of bolt slip need not exceed \( P_{ydc} / \alpha_s \).

2. Gusset Plate Requirements

Lateral bracing consistent with that used in the tests upon which the design is based is required.

User Note: This provision may be met by designing the gusset plate for a transverse force consistent with transverse bracing forces determined from testing, by adding a stiffener to it to resist this force, or by providing a brace to the gusset plate. Where the supporting tests did not include transverse bracing, no such bracing is required. Any attachment of bracing to the steel core must be included in the qualification testing.
**F4.6d. Column Splices**

Column splices shall comply with the requirements of Section D2.5. Where groove welds are used to make the splice, they shall be complete-joint-penetration groove welds. Column splices shall be designed to develop at least 50% of the lesser plastic flexural strength, $M_p$, of the connected members, divided by $\alpha_s$.

The required shear strength, $V_r$, shall be determined as follows:

$$V_r = \frac{\sum M_p}{\alpha_s H_c} \quad (F4-2)$$

where

- $H_c$ = clear height of the column between beam connections, including a structural slab, if present, in. (mm)
- $\sum M_p$ = sum of the plastic flexural strengths, $F_y Z$, top and bottom ends of the column, kip-in. (N-mm)

---

**F5. SPECIAL PLATE SHEAR WALLS (SPSW)**

**F5.1. Scope**

Special plate shear walls (SPSW) of structural steel shall be designed in conformance with this section. This section is applicable to frames with steel web plates connected to beams and columns.

**F5.2. Basis of Design**

SPSW designed in accordance with these provisions are expected to provide significant inelastic deformation capacity primarily through web plate yielding and as plastic-hinge formation in the ends of horizontal boundary elements (HBEs). Vertical boundary elements (VBEs) are not expected to yield in shear; VBEs are not expected to yield in flexure except at the column base.

**F5.3. Analysis**

The webs of SPSW shall not be considered as resisting gravity forces.

(a) An analysis in conformance with the applicable building code shall be performed. The required strength of web plates shall be 100% of the required shear strength of the frame from this analysis. The required strength of the frame consisting of VBEs and HBEs alone shall be not less than 25% of the frame shear force from this analysis.

(b) The required strength of HBEs, VBEs, and connections in SPSW shall be determined using the capacity-limited seismic load effect. The capacity-limited horizontal seismic load effect, $E_{cl}$, shall be determined from an analysis in which all webs are assumed to resist forces corresponding to their expected strength in tension at an angle, $\alpha$, as determined in Section F5.5b and HBE are resisting flexural forces at...
each end equal to $1.1R_yM_p/\alpha_s$. Webs shall be determined to be in tension neglecting the effects of gravity loads.

The expected web yield stress shall be taken as $R_yF_y$. When perforated walls are used, the effective expected tension stress is as defined in Section F5.7a.4.

Exception: The required strength of VBEs need not exceed the forces determined from nonlinear analysis as defined in Section C3.

**User Note:** Shear forces per Equation E1-1 must be included in this analysis. Designers should be aware that in some cases forces from the analysis in the applicable building code will govern the design of HBEs.

**User Note:** Shear forces in beams and columns are likely to be high and shear yielding must be evaluated.

### F5.4. System Requirements

#### F5.4a. Stiffness of Boundary Elements

The stiffness of vertical boundary elements (VBEs) and horizontal boundary elements (HBEs) shall be such that the entire web plate is yielded at the design story drift. VBE and HBE conforming to the following requirements shall be deemed to comply with this requirement. The vertical boundary elements (VBEs) shall have moments of inertia about an axis taken perpendicular to the plane of the web, $I_c$, not less than $0.0031t_w h^4/L$. The horizontal boundary elements (HBEs) shall have moments of inertia about an axis taken perpendicular to the plane of the web, $I_h$, not less than $0.0031L^4/h$ times the difference in web plate thicknesses above and below.

where

\[
\begin{align*}
I_b &= \text{moment of inertia of a HBE taken perpendicular to the direction of the web plate line, in.}^4 (\text{mm}^4) \\
I_c &= \text{moment of inertia of a VBE taken perpendicular to the direction of the web plate line, in.}^4 (\text{mm}^4) \\
L &= \text{distance between VBE centerlines, in. (mm)} \\
h &= \text{distance between HBE centerlines, in. (mm)} \\
t_w &= \text{thickness of the web, in. (mm)}
\end{align*}
\]

#### F5.4b. HBE-to-VBE Connection Moment Ratio

The moment ratio provisions in Section E3.4a shall be met for all HBE/VBE intersections without including the effects of the webs.

#### F5.4c. Bracing

HBE shall be braced to satisfy the requirements for moderately ductile members in Section D1.2a.
F5.4d. Openings in Webs

Openings in webs shall be bounded on all sides by intermediate boundary elements extending the full width and height of the panel respectively, unless otherwise justified by testing and analysis or permitted by Section F5.7.

F5.5. Members

F5.5a. Basic Requirements

HBE, VBE and intermediate boundary elements shall satisfy the requirements of Section D1.1 for highly ductile members.

F5.5b. Webs

The panel design shear strength, $\phi V_n$ (LRFD), and the allowable shear strength, $V_n/\Omega$ (ASD), in accordance with the limit state of shear yielding, shall be determined as follows:

$$V_n = 0.42F_y t_w L_{cf} \sin 2\alpha$$

where

- $\phi = 0.90$ (LRFD)
- $\Omega = 1.67$ (ASD)
- $L_{cf}$ = clear distance between column flanges, in. (mm)
- $t_w$ = thickness of the web, in. (mm)
- $\alpha$ = angle of web yielding in degrees, as measured relative to the vertical. The angle of inclination, $\alpha$, is permitted to be taken as $40^\circ$, or is permitted to be calculated as follows:

$$\tan^4 \alpha = \frac{1 + \frac{t_wL}{2A_h}}{1 + \frac{h^3}{360L_cL}}$$

where

- $A_b$ = cross-sectional area of an HBE, in.$^2$ (mm$^2$)
- $A_c$ = cross-sectional area of a VBE, in.$^2$ (mm$^2$)

F5.5c. HBE

HBE shall be designed to preclude flexural yielding at regions other than near the beam-to-column connection. Either of the following is deemed to comply with this requirement:

(a) HBE with available strength to resist twice the simple-span beam moment based on gravity loading and web-plate yielding.

(b) HBE with available strength to resist the simple-span beam moment based on gravity loading and web-plate yielding and with reduced flanges meeting the requirements of ANSI/AISC 358 Section 5.8 Step 1 with $c = 0.25b_f$. 
F5.5d. Protected Zone

The protected zone of SPSW shall satisfy Section D1.3 and include the following:

1. The webs of SPSW
2. Elements that connect webs to HBEs and VBEs
3. The plastic hinging zones at each end of HBEs, over a region ranging from the face of the column to one beam depth beyond the face of the column, or as otherwise specified in Section E3.5c

F5.6. Connections

F5.6a. Demand Critical Welds

The following welds are demand critical welds, and shall satisfy the requirements of Section A3.4b and I2.3:

a. Groove welds at column splices
b. Welds at column-to-base plate connections

Exception: Where it can be shown that column hinging at, or near, the base plate is precluded by conditions of restraint, and in the absence of net tension determined using the overstrength seismic load, demand critical welds are not required.

c. Welds at HBE-to-VBE connections

F5.6b. HBE-to-VBE Connections

HBE-to-VBE connections shall satisfy the requirements of Section E1.6b.

1. Required Strength

The required shear strength of an HBE-to-VBE connection shall be determined using the capacity-limited seismic load effect. The capacity-limited horizontal seismic load effect, $E_{cl}$, shall be taken as the shear calculated from Equation E1-1 together with the shear resulting from the expected yield strength in tension of the webs yielding at an angle $\alpha$.

2. Panel Zones

The VBE panel zone next to the top and base HBE of the SPSW shall comply with the requirements in Section E3.6e.

F5.6c. Connections of Webs to Boundary Elements

The required strength of web connections to the surrounding HBE and VBE shall equal the
expected yield strength, in tension, of the web calculated at an angle $\alpha$.

**F5.6d. Column Splices**

Column splices shall comply with the requirements of Section D2.5. Where welds are used to make the splice, they shall be complete-joint-penetration groove welds. Column splices shall be designed to develop at least 50% of the lesser plastic flexural strength, $M_p$, of the connected members, divided by $\alpha_s$. The required shear strength, $V_r$, shall be determined by Equation F4-2.

**F5.7. Perforated Webs**

**F5.7a. Regular Layout of Circular Perforations**

A perforated plate conforming to this section is permitted to be used as the web of an SPSW. Perforated webs shall have a regular pattern of holes of uniform diameter spaced evenly over the entire web-plate area in an array pattern so that holes align diagonally at a uniform angle to vertical. A minimum of four horizontal and four vertical lines of holes shall be used. Edges of openings shall have a surface roughness of 500 $\mu$-in. (13 microns) or less.

1. **Strength**

The panel design shear strength, $\phi V_n$ (LRFD), and the allowable shear strength, $V_n/\Omega$ (ASD), in accordance with the limit state of shear yielding, shall be determined as follows for perforated webs with holes that align diagonally at $45^\circ$ from the horizontal:

$$V_n = 0.42 F_{yw} L_{cf} \left( 1 - \frac{0.7D}{S_{diag}} \right)$$

$$\phi = 0.90 \text{ (LRFD)} \quad \Omega = 1.67 \text{ (ASD)}$$

where

- $D$ = diameter of the holes, in. (mm)
- $S_{diag}$ = shortest center-to-center distance between the holes measured on the $45^\circ$ diagonal, in. (mm)

**User Note:** Perforating webs in accordance with Section F5.7a forces the development of web yielding in a direction parallel to that of the holes alignment. As such, for the case addressed by Section F5.7a, $\alpha$ is equal to $45^\circ$.

2. **Spacing**

The spacing, $S_{diag}$, shall be at least 1.67$D$. 
The distance between the first holes and web connections to the HBEs and VBEs shall be at least \( D \), but shall not exceed \( (D+0.7S_{\text{diag}}) \).

3. **Stiffness**

The stiffness of such regularly perforated infill plates shall be calculated using an effective web-plate thickness, \( t_{\text{eff}} \), given by:

\[
t_{\text{eff}} = \frac{1 - \frac{\pi}{4} \left( \frac{D}{S_{\text{diag}}} \right)}{1 - \frac{\pi}{4} \left( \frac{D}{S_{\text{diag}}} \right) \left( 1 - \frac{N_r D \sin \alpha}{H_c} \right) t_w}
\]

where

- \( H_c \) = clear column (and web-plate) height between beam flanges, in. (mm)
- \( N_r \) = number of horizontal rows of perforations
- \( t_w \) = web-plate thickness, in. (mm)
- \( \alpha \) = angle of the shortest center-to-center lines in the opening array to vertical, degrees

4. **Effective Expected Tension Stress**

The effective expected tension stress to be used in place of the effective tension stress for analysis per Section F5.3 is \( R_y F_y (1 - 0.7 D/S_{\text{diag}}) \).

**F5.7b. Reinforced Corner Cut-Out**

Quarter-circular cut-outs are permitted at the corners of the webs provided that the webs are connected to a reinforcement arching plate following the edge of the cut-outs. The plates shall be designed to allow development of the full strength of the solid web and maintain its resistance when subjected to deformations corresponding to the design story drift. This is deemed to be achieved if the following conditions are met.

1. **Design for Tension**

The arching plate shall have the available strength to resist the axial tension force resulting from web-plate tension in the absence of other forces:

\[
P_r = \frac{R_y F_y t_w R^2 / \alpha_s}{4e}
\]

where
HBEs and VBEs shall be designed to resist the tension axial forces acting at the end of the arching reinforcement.

2. Design for Combined Axial and Flexural Forces

The arching plate shall have the available strength to resist the combined effects of axial force and moment in the plane of the web resulting from connection deformation in the absence of other forces. These forces are:

\[
P_r = \frac{15EI_y}{\alpha_y 16e^2} \left( \frac{\Delta}{H} \right)
\]  \hspace{1cm} (F5-7)

The moments are:

\[
M_r = P_r e
\]  \hspace{1cm} (F5-8)

where

- \( E \) = modulus of elasticity, ksi (MPa)
- \( H \) = height of story, in. (mm)
- \( I_y \) = moment of inertia of the plate about the \( y \)-axis, in.\(^4\) (mm\(^4\))
- \( \Delta \) = design story drift, in. (mm)

HBEs and VBEs shall be designed to resist the combined axial and flexural forces acting at the end of the arching reinforcement.
CHAPTER G

COMPOSITE MOMENT-FRAME SYSTEMS

This chapter provides the basis of design, the requirements for analysis, and the requirements for the system, members and connections for composite moment frame systems.

The chapter is organized as follows:

G1. Composite Ordinary Moment Frames (C-OMF)
G2. Composite Intermediate Moment Frames (C-IMF)
G3. Composite Special Moment Frames (C-SMF)
G4. Composite Partially Restrained Moment Frames (C-PRMF)

User Note: The requirements of this chapter are in addition to those required by the Specification and the applicable building code.

G1. COMPOSITE ORDINARY MOMENT FRAMES (C-OMF)

G1.1. Scope

Composite ordinary moment frames (C-OMF) shall be designed in conformance with this section. This section is applicable to moment frames with fully restrained (FR) connections that consist of either composite or reinforced concrete columns and structural steel, concrete-encased composite, or composite beams.

G1.2. Basis of Design

C-OMF designed in accordance with these provisions are expected to provide minimal inelastic deformation capacity in their members and connections.

User Note: Composite ordinary moment frames, comparable to reinforced concrete ordinary moment frames, are only permitted in seismic design categories B or below in ASCE/SEI 7. This is in contrast to steel ordinary moment frames, which are permitted in higher seismic design categories. The design requirements are commensurate with providing minimal ductility in the members and connections.

G1.3. Analysis

There are no additional analysis requirements.

G1.4. System Requirements
There are no additional system requirements.

**G1.5. Members**

There are no additional requirements for steel or composite members beyond those in the Specification. Reinforced concrete columns shall satisfy the requirements of ACI 318, excluding Chapter 18.

**G1.5a. Protected Zones**

There are no designated protected zones.

**G1.6. Connections**

Connections shall be fully restrained (FR). Connections shall be designed for the applicable load combinations as described in Sections B2 and B3.

**G1.6a. Demand Critical Welds**

There are no requirements for demand critical welds.

**G2. COMPOSITE INTERMEDIATE MOMENT FRAMES (C-IMF)**

**G2.1. Scope**

Composite intermediate moment frames (C-IMF) shall be designed in conformance with this section. This section is applicable to moment frames with fully restrained (FR) connections that consist of composite or reinforced concrete columns and structural steel, concrete-encased composite or composite beams.

**G2.2. Basis of Design**

C-IMF designed in accordance with these provisions are expected to provide limited inelastic deformation capacity through flexural yielding of the C-IMF beams and columns, and shear yielding of the column panel zones. Design of connections of beams to columns, including panel zones, continuity plates and diaphragms shall provide the performance required by Section G2.6b, and demonstrate this conformance as required by Section G2.6c.

**User Note:** Composite intermediate moment frames, comparable to reinforced concrete intermediate moment frames, are only permitted in seismic design categories C or below in ASCE/SEI 7. This is in contrast to steel intermediate moment frames, which are permitted in higher seismic design categories. The design requirements are commensurate with providing limited ductility in the members and...
connections.

G2.3. Analysis

There are no additional analysis requirements.

G2.4. System Requirements

G2.4a. Stability Bracing of Beams

Beams shall be braced to satisfy the requirements for moderately ductile members in Section D1.2a.

In addition, unless otherwise indicated by testing, beam braces shall be placed near concentrated forces, changes in cross section, and other locations where analysis indicates that a plastic hinge will form during inelastic deformations of the C-IMF.

The required strength of stability bracing provided adjacent to plastic hinges shall be as required by Section D1.2c.

G2.5. Members

G2.5a. Basic Requirements

Steel and composite members shall satisfy the requirements of Section D1.1 for moderately ductile members.

G2.5b. Beam Flanges

Abrupt changes in the beam flange area are prohibited in plastic hinge regions. The drilling of flange holes or trimming of beam flange width is not permitted unless testing or qualification demonstrates that the resulting configuration is able to develop stable plastic hinges to accommodate the required story drift angle.

G2.5c. Protected Zones

The region at each end of the beam subject to inelastic straining shall be designated as a protected zone, and shall satisfy the requirements of Section D1.3.

User Note: The plastic hinge zones at the ends of C-IMF beams should be treated as protected zones. In general, the protected zone will extend from the face of the composite column to one-half of the beam depth beyond the plastic hinge point.

G2.6. Connections
Connections shall be fully-restrained (FR) and shall satisfy the requirements of Section D2 and this section.

G2.6a. Demand Critical Welds

There are no requirements for demand critical welds.

G2.6b. Beam-to-Column Connections

Beam-to-composite column connections used in the SFRS shall satisfy the following requirements:

(a) The connection shall be capable of accommodating a story drift angle of at least 0.02 rad.

(b) The measured flexural resistance of the connection, determined at the column face, shall equal at least 0.80\(M_p\) of the connected beam at a story drift angle of 0.02 rad, where \(M_p\) is defined as the plastic flexural strength of the steel, concrete-encased or composite beams and shall satisfy the requirements of Specification Chapter I.

G2.6c. Conformance Demonstration

Beam-to-column connections used in the SFRS shall satisfy the requirements of Section G2.6b by one of the following:

(a) Use of C-IMF connections designed in accordance with ANSI/AISC 358.

(b) Use of a connection prequalified for C-IMF in accordance with Section K1.

(c) Results of at least two qualifying cyclic test results conducted in accordance with Section K2. The tests are permitted to be based on one of the following:
   (i) Tests reported in the research literature or documented tests performed for other projects that represent the project conditions, within the limits specified in Section K2.
   (ii) Tests that are conducted specifically for the project and are representative of project member sizes, material strengths, connection configurations, and matching connection processes, within the limits specified in Section K2.

(d) Calculations that are substantiated by mechanistic models and component limit state design criteria consistent with these provisions.

G2.6d. Required Shear Strength

The required shear strength of the connection shall be determined using the capacity-limited seismic load effect. The capacity-limited
horizontal seismic load effect, $E_{cl}$, shall be taken as:

$$E_{cl} = 2(1.1M_{p,exp})/L_h$$  \hspace{1cm} (G2-1)

where $M_{p,exp}$ is the expected flexural strength of the steel, concrete-encased or composite beam, kip-in. (N-mm). For a concrete-encased or composite beam, $M_{p,exp}$ shall be calculated using the plastic stress distribution or the strain compatibility method. Applicable $R_y$ factors shall be used for different elements of the cross section while establishing section force equilibrium and calculating the flexural strength. $L_h$ shall be equal to the distance between beam plastic hinge locations, in. (mm).

**User Note:** For steel beams, $M_{p,exp}$ in Equation G2-1 may be taken as $R_yM_p$ of the beam.

**G2.6e. Connection Diaphragm Plates**

Connection diaphragm plates are permitted for filled composite columns both external to the column and internal to the column.

Where diaphragm plates are used, the thickness of the plates shall be at least the thickness of the beam flange.

The diaphragm plates shall be welded around the full perimeter of the column using either complete-joint-penetration groove welds or two sided fillet welds. The required strength of these joints shall not be less than the available strength of the contact area of the plate with the column sides.

Internal diaphragms shall have circular openings sufficient for placing the concrete.

**G2.6f. Column Splices**

In addition to the requirements of Section D2.5, column splices shall comply with the requirements of this section. Where welds are used to make the splice, they shall be complete-joint-penetration groove welds. When column splices are not made with groove welds, they shall have a required flexural strength that is at least equal to the nominal flexural strength, $M_{pcce}$ of the smaller composite column. The required shear strength of column web splices shall be at least equal to $\Sigma M_{pcc}/H$, where $\Sigma M_{pcc}$ is the sum of the plastic flexural strengths at the top and bottom ends of the composite column. For composite columns, the nominal flexural strength shall satisfy the requirements of Specification Chapter I including the required axial strength, $P_{rc}$. 
CHAPTER G

G3. COMPOSITE SPECIAL MOMENT FRAMES (C-SMF)

G3.1. Scope

Composite special moment frames (C-SMF) shall be designed in conformance with this section. This section is applicable to moment frames with fully restrained (FR) connections that consist of either composite or reinforced concrete columns and either structural steel or concrete-encased composite or composite beams.

G3.2. Basis of Design

C-SMF designed in accordance with these provisions are expected to provide significant inelastic deformation capacity through flexural yielding of the C-SMF beams and limited yielding of the column panel zones. Except where otherwise permitted in this section, columns shall be designed to be stronger than the fully yielded and strain-hardened beams or girders. Flexural yielding of columns at the base is permitted. Design of connections of beams to columns, including panel zones, continuity plates and diaphragms shall provide the performance required by Section G3.6b, and demonstrate this conformance as required by Section G3.6c.

G3.3. Analysis

There are no additional analysis requirements.

G3.4. System Requirements

G3.4a. Moment Ratio

The following relationship shall be satisfied at beam-to-column connections:

\[
\frac{\sum M^*_{pcc}}{\sum M^*_{p,exp}} > 1.0 \quad (G3-1)
\]

where

\[
\sum M^*_{pcc} = \text{sum of the moments in the columns above and below the joint at the intersection of the beam and column centerlines, kip-in. (N-mm).} \quad \sum M^*_{p,exp} \text{ is determined by summing the projections of the nominal flexural strengths, } M_{pcc} \text{ of the columns (including haunches where used) above and below the joint to the beam centerline with a reduction for the axial force in the column. For composite columns, the nominal flexural strength, } M_{pcc} \text{ shall satisfy the requirements of}
\]
Specification Chapter I including the required axial strength, $P_{rc}$. For reinforced concrete columns, the nominal flexural strength, $M_{pcc}$, shall be calculated based on the provisions of ACI 318 including the required axial strength, $P_{rc}$. When the centerlines of opposing beams in the same joint do not coincide, the mid-line between centerlines shall be used.

$$\Sigma M_{p,exp} = \text{sum of the moments in the steel beams or concrete-encased composite beams at the intersection of the beam and column centerlines, kip-in. (N-mm).}$$

$\Sigma M_{p,exp}$ is determined by summing the expected flexural strengths of the beams at the plastic hinge locations to the column centerline. It is permitted to take $\Sigma M_{p,exp} = \Sigma (1.1M_{p,exp} + M_{uv})$, where $M_{p,exp}$ is calculated as specified in Section G2.6d.

$$M_{uv} = \text{moment due to shear amplification from the location of the plastic hinge to the column centerline, kip-in. (N-mm).}$$

Exception: The exceptions of Section E3.4a shall apply except that the force limit in Section E3.4a shall be $P_{rc} < 0.1P_c$.

**G3.4b. Stability Bracing of Beams**

Beams shall be braced to satisfy the requirements for highly ductile members in Section D1.2b.

In addition, unless otherwise indicated by testing, beam braces shall be placed near concentrated forces, changes in cross section, and other locations where analysis indicates that a plastic hinge will form during inelastic deformations of the C-SMF.

The required strength of stability bracing provided adjacent to plastic hinges shall be as required by Section D1.2c.

**G3.4c. Stability Bracing at Beam-to-Column Connections**

Composite columns with unbraced connections shall satisfy the requirements of Section E3.4c.2.

**G3.5. Members**

**G3.5a. Basic Requirements**

Steel and composite members shall satisfy the requirements of Sections D1.1 for highly ductile members.
Exception: Reinforced concrete-encased beams shall satisfy the requirements for Section D1.1 for moderately ductile members if the reinforced concrete cover is at least 2 in. (50 mm) and confinement is provided by hoop reinforcement in regions where plastic hinges are expected to occur under seismic deformations. Hoop reinforcement shall satisfy the requirements of ACI 318 Section 18.6.4.

Concrete-encased composite beams that are part of C-SMF shall also satisfy the following requirement. The distance from the maximum concrete compression fiber to the plastic neutral axis shall not exceed:

\[
Y_{PNA} = \frac{Y_{con} + d}{1 + \left(\frac{1,700F_y}{E}\right)}
\]

where

\[E\] = modulus of elasticity of the steel beam, ksi (MPa)

\[F_y\] = specified minimum yield stress of the steel beam, ksi (MPa)

\[Y_{con}\] = distance from the top of the steel beam to the top of the concrete, in. (mm)

\[d\] = overall beam depth, in. (mm)

G3.5b. Beam Flanges

Abrupt changes in beam flange area are prohibited in plastic hinge regions. The drilling of flange holes or trimming of beam flange width is prohibited unless testing or qualification demonstrates that the resulting configuration can develop stable plastic hinges to accommodate the required story drift angle.

G3.5c. Protected Zones

The region at each end of the beam subject to inelastic straining shall be designated as a protected zone, and shall satisfy the requirements of Section D1.3.

User Note: The plastic hinge zones at the ends of C-SMF beams should be treated as protected zones. In general, the protected zone will extend from the face of the composite column to one-half of the beam depth beyond the plastic hinge point.

G3.6. Connections

Connections shall be fully restrained (FR) and shall satisfy the requirements of Section D2 and this section.
User Note: All subsections of Section D2 are relevant for C-SMF.

**G3.6a. Demand Critical Welds**

The following welds are demand critical welds, and shall satisfy the requirements of Section A3.4b and I2.3:

(a) Groove welds at column splices

(b) Welds at the column-to-base plate connections

Exception: Where it can be shown that column hinging at or near the base plate is precluded by conditions of restraint, and in the absence of net tension under load combinations including overstrength seismic load, demand critical welds are not required.

(c) Complete-joint-penetration groove welds of beam flanges to columns, diaphragm plates that serve as a continuation of beam flanges, shear plates within the girder depth that transition from the girder to an encased steel shape, and beam webs to columns

**G3.6b. Beam-to-Column Connections**

Beam-to-composite column connections used in the SFRS shall satisfy the following requirements:

(a) The connection shall be capable of accommodating a story drift angle of at least 0.04 rad.

(b) The measured flexural resistance of the connection, determined at the column face, shall equal at least 0.80$M_p$ of the connected beam at a story drift angle of 0.04 rad, where $M_p$ is calculated as in Section G2.6b.

**G3.6c. Conformance Demonstration**

Beam-to-composite column connections used in the SFRS shall satisfy the requirements of Section G3.6b by one of the following:

(a) Use of C-SMF connections designed in accordance with ANSI/AISC 358

(b) Use of a connection prequalified for C-SMF in accordance with Section K1.

(c) The connections shall be qualified using test results obtained in accordance with Section K2. Results of at least two cyclic connection tests shall be provided, and shall be based on one of
the following:

(1) Tests reported in research literature or documented tests performed for other projects that represent the project conditions, within the limits specified in Section K2.

(2) Tests that are conducted specifically for the project and are representative of project member sizes, material strengths, connection configurations, and matching connection processes, within the limits specified by Section K2.

(d) When beams are uninterrupted or continuous through the composite or reinforced concrete column, beam flange welded joints are not used, and the connection is not otherwise susceptible to premature fracture, other substantiating data is permitted to demonstrate conformance.

Connections that accommodate the required story drift angle within the connection elements and provide the measured flexural resistance and shear strengths specified in Section G3.6d are permitted. In addition to satisfying the preceding requirements, the design shall demonstrate that any additional drift due to connection deformation is accommodated by the structure. The design shall include analysis for stability effects of the overall frame, including second-order effects.

G3.6d. Required Shear Strength

The required shear strength of the connection, \(V_u\), shall be determined using the capacity-limited seismic load effect. The capacity-limited horizontal seismic load effect, \(E_{cl}\), shall be taken as:

\[
E_{cl} = 2[1.1M_{p,exp}] / L_h
\]  

(G3-3)

where \(M_{p,exp}\) is the expected flexural strength of the steel, concrete-encased, or composite beams. For concrete-encased or composite beams, \(M_{p,exp}\) shall be calculated according to Section G2.6d, and \(L_h\) shall be equal to the distance between beam plastic hinge locations, in. (mm).

G3.6e. Connection Diaphragm Plates

The continuity plates or diaphragms used for infilled column moment connections shall satisfy the requirements of Section G2.6e.

G3.6f. Column Splices

Composite column splices shall satisfy the requirements of Section
G4. COMPOSITE PARTIALLY RESTRAINED MOMENT FRAMES (C-PRMF)

G4.1. Scope

Composite partially restrained moment frames (C-PRMF) shall be designed in conformance with this section. This section is applicable to moment frames that consist of structural steel columns and composite beams that are connected with partially restrained (PR) moment connections that satisfy the requirements in Specification Section B3.4b(b).

G4.2. Basis of Design

C-PRMF designed in accordance with these provisions are expected to provide significant inelastic deformation capacity through yielding in the ductile components of the composite PR beam-to-column moment connections. Flexural yielding of columns at the base is permitted. Design of connections of beams to columns shall be based on connection tests that provide the performance required by Section G4.6c, and demonstrate this conformance as required by Section G4.6d.

G4.3. Analysis

Connection flexibility and composite beam action shall be accounted for in determining the dynamic characteristics, strength and drift of C-PRMF.

For purposes of analysis, the stiffness of beams shall be determined with an effective moment of inertia of the composite section.

G4.4. System Requirements

There are no additional system requirements.

G4.5. Members

G4.5a. Columns

Steel columns shall satisfy the requirements of Sections D1.1 for moderately ductile members.

G4.5b. Beams

Composite beams shall be unencased, fully composite, and shall meet the requirements of Section D1.1 for moderately ductile members. A
solid slab shall be provided for a distance of 12 in. (300 mm) from the
face of the column in the direction of moment transfer.

G4.5c. Protected Zones

There are no designated protected zones.

G4.6. Connections

Connections shall be partially restrained (PR) and shall satisfy the
requirements of Section D2 and this section.

User Note: All subsections of Section D2 are relevant for C-PRMF.

G4.6a. Demand Critical Welds

The following welds are demand critical welds, and shall satisfy the
requirements of Section A3.4b and I2.3:

(a) Groove welds at column splices
(b) Welds at the column-to-base plate connections

Exception: Where it can be shown that column hinging at or near the
base plate is precluded by conditions of restraint, and in the absence of
net tension under load combinations including the overstrength seismic
load, demand critical welds are not required.

G4.6b. Required Strength

The required strength of the beam-to-column PR moment connections
shall be determined including the effects of connection flexibility and
second-order moments.

G4.6c. Beam-to-Column Connections

Beam-to-composite column connections used in the SFRS shall satisfy
the following requirements:

(a) The connection shall be capable of accommodating a
connection rotation of at least 0.02 rad.

(b) The measured flexural resistance of the connection determined
at the column face shall increase monotonically to a value of at
least 0.5\(M_p\) of the connected beam at a connection rotation of
0.02 rad, where \(M_p\) is defined as the moment corresponding to
plastic stress distribution over the composite cross section, and
shall satisfy the requirements of Specification Chapter I.

G4.6d. Conformance Demonstration
Beam-to-column connections used in the SFRS shall satisfy the requirements of Section G4.6c by provision of qualifying cyclic test results in accordance with Section K2. Results of at least two cyclic connection tests shall be provided, and shall be based on one of the following:

(a) Tests reported in research literature or documented tests performed for other projects that represent the project conditions, within the limits specified in Section K2.

(b) Tests that are conducted specifically for the project and are representative of project member sizes, material strengths, connection configurations, and matching connection processes, within the limits specified by Section K2.

G4.6e. Column Splices

Column splices shall satisfy the requirements of Section G2.6f.
CHAPTER H

COMPOSITE BRACED-FRAME AND SHEAR-WALL SYSTEMS

This chapter provides the basis of design, the requirements for analysis, and the requirements for the system, members and connections for composite braced frame and shear wall systems.

The chapter is organized as follows:

H1. Composite Ordinary Braced Frames (C-OBF)
H2. Composite Special Concentrically Braced Frames (C-SCBF)
H3. Composite Eccentrically Braced Frames (C-EBF)
H4. Composite Ordinary Shear Walls (C-OSW)
H5. Composite Special Shear Walls (C-SSW)
H6. Composite Plate Shear Walls—Concrete Encased (C-PSW/CE)
H7. Composite Plate Shear Walls—Concrete Filled (C-PSW/CF)

User Note: The requirements of this chapter are in addition to those required by the Specification and the applicable building code.

H1. COMPOSITE ORDINARY BRACED FRAMES (C-OBF)

H1.1. Scope

Composite ordinary braced frames (C-OBF) shall be designed in conformance with this section. Columns shall be structural steel, encased composite, filled composite or reinforced concrete members. Beams shall be either structural steel or composite beams. Braces shall be structural steel or filled composite members. This section is applicable to braced frames that consist of concentrically connected members where at least one of the elements (columns, beams or braces) is a composite or reinforced concrete member.

H1.2. Basis of Design

This section is applicable to braced frames that consist of concentrically connected members. Eccentricities less than the beam depth are permitted if they are accounted for in the member design by determination of eccentric moments.

C-OBF designed in accordance with these provisions are expected to provide limited inelastic deformations in their members and connections.

User Note: Composite ordinary braced frames, comparable to other steel braced frames designed per the Specification using $R = 3$, are only permitted in seismic design categories A, B or C in ASCE/SEI 7. This is
in contrast to steel ordinary braced frames, which are permitted in higher seismic design categories. The design requirements are commensurate with providing minimal ductility in the members and connections.

H1.3. Analysis
There are no additional analysis requirements.

H1.4. System Requirements
There are no additional system requirements.

H1.5. Members

H1.5a. Basic Requirements
There are no additional requirements.

H1.5b. Columns
There are no additional requirements, for structural steel and composite columns. Reinforced concrete columns shall satisfy the requirements of ACI 318, excluding Chapter 18.

H1.5c. Braces
There are no additional requirements for structural steel and filled composite braces.

H1.5d. Protected Zones
There are no designated protected zones.

H1.6. Connections
Connections shall satisfy the requirements of Section D2.7.

H1.6a. Demand Critical Welds
There are no requirements.

H2. COMPOSITE SPECIAL CONCENTRICALLY BRACED FRAMES (C-SCBF)

H2.1. Scope
Composite special concentrically braced frames (C-SCBF) shall be designed in conformance with this section. Columns shall be encased or filled composite. Beams shall be either structural steel or composite beams. Braces shall be structural steel or filled composite members.
CHAPTER H

Collector beams that connect C-SCBF braces shall be considered to be part of the C-SCBF.

H2.2. Basis of Design

This section is applicable to braced frames that consist of concentrically connected members. Eccentricities less than the beam depth are permitted if the resulting member and connection forces are addressed in the design and do not change the expected source of inelastic deformation capacity.

C-SCBF designed in accordance with these provisions are expected to provide significant inelastic deformation capacity primarily through brace buckling and yielding of the brace in tension.

H2.3. Analysis

The analysis requirements for C-SCBF shall satisfy the analysis requirements of Section F2.3 modified to account for the entire composite section in determining the expected brace strengths in tension and compression.

H2.4. System Requirements

The system requirements for C-SCBF shall satisfy the system requirements of Section F2.4.

H2.5. Members

H2.5a. Basic Requirements

Composite columns and steel or composite braces shall satisfy the requirements of Section D1.1 for highly ductile members. Steel or composite beams shall satisfy the requirements of Section D1.1 for moderately ductile members.

User Note: In order to satisfy this requirement, the actual width-to-thickness ratio of square and rectangular filled composite braces may be multiplied by a factor, \([(0.264 + 0.0082KL/r)\], for \(KL/r\) between 35 and 90; \(KL/r\) being the effective slenderness ratio of the brace.

H2.5b. Diagonal Braces

Structural steel and filled composite braces shall satisfy the requirements for SCBF of Section F2.5b. The radius of gyration in Section F2.5b shall be taken as that of the steel section alone.

H2.5c. Protected Zones

The protected zone of C-SCBF shall satisfy Section D1.3 and include the following:
(1) For braces, the center one-quarter of the brace length and a zone adjacent to each connection equal to the brace depth in the plane of buckling

(2) Elements that connect braces to beams and columns.

H2.6. Connections

Design of connections in C-SCBF shall be based on Section D2 and the provisions of this section.

H2.6a. Demand Critical Welds

The following welds are demand critical welds, and shall satisfy the requirements of Section A3.4b and I2.3:

(a) Groove welds at column splices

(b) Welds at the column-to-base plate connections

Exception: Where it can be shown that column hinging at, or near, the base plate is precluded by conditions of restraint, and in the absence of net tension under load combinations including overstrength seismic load, demand critical welds are not required.

(c) Welds at beam-to-column connections conforming to Section H2.6b(b)

H2.6b. Beam-to-Column Connections

Where a brace or gusset plate connects to both members at a beam-to-column connection, the connection shall conform to one of the following:

(a) The connection shall be a simple connection meeting the requirements of Specification Section B3.4a where the required rotation is taken to be 0.025 rad; or

(b) Beam-to-column connections shall satisfy the requirements for FR moment connections as specified in Sections D2, G2.6d and G2.6e.

The required flexural strength of the connection shall be determined from analysis and shall be considered in combination with the required strength of the brace connection and beam connection, including the diaphragm collector forces determined using the overstrength seismic load.
H2.6c. Brace Connections

Brace connections shall satisfy the requirement of Section F2.6c, except that the required strength shall be modified to account for the entire composite section in determining the expected brace strength in tension and compression. Applicable $R_y$ factors shall be used for different elements of the cross section for calculating the expected brace strength. The expected brace flexural strength shall be determined as $M_{p,exp}$, where $M_{p,exp}$ is calculated as specified in Section G2.6d.

H2.6d. Column Splices

In addition to the requirements of Section D2.5, column splices shall comply with the requirements of this section. Where welds are used to make the splice, they shall be complete-joint-penetration groove welds. When column splices are not made with groove welds, they shall have a required flexural strength that is at least equal to the nominal flexural strength, $M_{pcc}$, of the smaller composite column. The required shear strength of column web splices shall be at least equal to $\sum M_{pcc}/H$, where $\sum M_{pcc}$ is the sum of the nominal flexural strengths at the top and bottom ends of the composite column. The nominal flexural strength shall satisfy the requirements of Specification Chapter I with consideration of the required axial strength, $P_{rc}$.

H3. COMPOSITE ECCENTRICALLY BRACED FRAMES (C-EBF)

H3.1. Scope

Composite eccentrically braced frames (C-EBF) shall be designed in conformance with this section. Columns shall be encased composite or filled composite. Beams shall be structural steel or composite beams. Links shall be structural steel. Braces shall be structural steel or filled composite members. This section is applicable to braced frames for which one end of each brace intersects a beam at an eccentricity from the intersection of the centerlines of the beam and an adjacent brace or column.

H3.2. Basis of Design

C-EBF shall satisfy the requirements of Section F3.2, except as modified in this section.

This section is applicable to braced frames for which one end of each brace intersects a beam at an eccentricity from the intersection of the centerlines of the beam and an adjacent brace or column, forming a link that is subject to shear and flexure. Eccentricities less than the beam depth are permitted in the brace connection away from the link if the
resulting member and connection forces are addressed in the design and do not change the expected source of inelastic deformation capacity.

C-EBF designed in accordance with these provisions are expected to provide significant inelastic deformation capacity primarily through shear or flexural yielding in the links.

The available strength of members shall satisfy the requirements in the Specification, except as modified in this section.

**H3.3. Analysis**

The analysis of C-EBF shall satisfy the analysis requirements of Section F3.3.

**H3.4. System Requirements**

The system requirements for C-EBF shall satisfy the system requirements of Section F3.4.

**H3.5. Members**

The member requirements of C-EBF shall satisfy the member requirements of Section F3.5.

**H3.6. Connections**

The connection requirements of C-EBF shall satisfy the connection requirements of Section F3.6 except as noted in the following.

**H3.6a. Beam-to-Column Connections**

Where a brace or gusset plate connects to both members at a beam-to-column connection, the connection shall conform to one of the following:

(a) The connection shall be a simple connection meeting the requirements of Specification Section B3.4a where the required rotation is taken to be 0.025 rad; or

(b) Beam-to-column connections shall satisfy the requirements for fully restrained (FR) moment connections as specified in Sections D2, G2.6d and G2.6e.

The required flexural strength of the connection shall be determined from analysis and shall be considered in combination with the required strength of the brace connection and beam connection, including the diaphragm collector forces determined using the overstrength seismic load.
H4. COMPOSITE ORDINARY SHEAR WALLS (C-OSW)

H4.1. Scope

Composite ordinary shear walls (C-OSW) shall be designed in conformance with this section. This section is applicable to uncoupled reinforced concrete shear walls with composite boundary elements, and coupled reinforced concrete shear walls, with or without composite boundary elements, with structural steel or composite coupling beams that connect two or more adjacent walls.

H4.2. Basis of Design

C-OSW designed in accordance with these provisions are expected to provide limited inelastic deformation capacity through yielding in the reinforced concrete walls and the steel or composite elements.

Reinforced concrete walls shall satisfy the requirements of ACI 318 excluding Chapter 18, except as modified in this section.

H4.3. Analysis

Analysis shall satisfy the requirements of Chapter C as modified in this section.

(a) Uncracked effective stiffness values for elastic analysis shall be assigned in accordance with ACI 318 Chapter 6 for wall piers and composite coupling beams.

(b) When concrete-encased shapes function as boundary members, the analysis shall be based upon a transformed concrete section using elastic material properties.

H4.4. System Requirements

In coupled walls, it is permitted to redistribute coupling beam forces vertically to adjacent floors. The shear in any individual coupling beam shall not be reduced by more than 20% of the elastically determined value. The sum of the coupling beam shear resistance over the height of the building shall be greater than or equal to the sum of the elastically determined values.

H4.5. Members

H4.5a. Boundary Members

Boundary members shall satisfy the following requirements:

(a) The required axial strength of the boundary member shall be determined assuming that the shear forces are carried by the...
reinforced concrete wall and the entire gravity and overturning forces are carried by the boundary members in conjunction with the shear wall.

(b) When the concrete-encased structural steel boundary member qualifies as a composite column as defined in Specification Chapter I, it shall be designed as a composite column to satisfy the requirements of Chapter I of the Specification.

c) Headed studs or welded reinforcement anchors shall be provided to transfer required shear strengths between the structural steel boundary members and reinforced concrete walls. Headed studs, if used, shall satisfy the requirements of Specification Chapter I. Welded reinforcement anchors, if used, shall satisfy the requirements of Structural Welding Code—Reinforcing Steel (AWS D1.4/D1.4M).

H4.5b. Coupling Beams

1. Structural Steel Coupling Beams

Structural steel coupling beams that are used between adjacent reinforced concrete walls shall satisfy the requirements of the Specification and this section. The following requirements apply to wide flange steel coupling beams.

(a) Steel coupling beams shall be designed in accordance with Chapters F and G of the Specification.

(b) The available connection shear strength, $\phi V_{n,\text{connection}}$, shall be computed from Equations H4-1 and H4-1M, with $\phi = 0.90$.

\[
V_{n,\text{connection}} = 1.54 \sqrt{f_c' \left( \frac{b}{b_f} \right)^{0.66}} \beta_i b_f L_e \left[ \frac{0.58 - 0.22 \beta}{0.88 + \frac{g}{2L_e}} \right]
\] (H4-1)

\[
V_{n,\text{connection}} = 4.04 \sqrt{f_c' \left( \frac{b}{b_f} \right)^{0.66}} \beta_i b_f L_e \left[ \frac{0.58 - 0.22 \beta}{0.88 + \frac{g}{2L_e}} \right] \quad \text{(S.I.)} \quad \text{(H4-1M)}
\]

where

$L_e = $ embedment length of coupling beam measured from the face of the wall, in. (mm)

$b_w = $ thickness of wall pier, in. (mm)
2016 Seismic Provisions for Structural Steel Buildings
PUBLIC REVIEW Draft Dated March 16, 2015
AMERICAN INSTITUTE OF STEEL CONSTRUCTION

2. Composite Coupling Beams

Encased composite sections serving as coupling beams shall satisfy the following requirements:

(a) Coupling beams shall have an embedment length into the reinforced concrete wall that is sufficient to develop the required shear strength, where the connection strength is calculated with Equation H4-1 or H4-1M.

The available shear strength of the composite beam, \( \phi V_{n,\text{comp}} \), is computed from Equation H4-2 and H4-2M, with \( \phi = 0.90 \).

\[
V_{n,\text{comp}} = V_p + \left( 0.0632 \sqrt{f_c' \cdot b_w d_c} + \frac{A_{sr} F_{ysr} d_c}{s} \right) \tag{H4-2}
\]

\[
V_{n,\text{comp}} = V_p + \left( 0.166 \sqrt{f_c' \cdot b_w d_c} + \frac{A_{sr} F_{ysr} d_c}{s} \right) \tag{S.I.} \tag{H4-2M}
\]

where

- \( A_{sr} \) = area of transverse reinforcement, \( \text{in.}^2 \) (\( \text{mm}^2 \))
- \( F_{ysr} \) = specified minimum yield stress of transverse reinforcement, ksi (MPa)
- \( V_p = 0.6 F_y A_w \), kips (N)
- \( A_w = \) area of steel beam web, \( \text{in.}^2 \) (\( \text{mm}^2 \))
b_{wc} = \text{width of concrete encasement, in. (mm)}
\begin{align*}
d_{c} &= \text{effective depth of concrete encasement, in. (mm)} \\
s &= \text{spacing of transverse reinforcement, in. (mm)}
\end{align*}

**H4.5c. Protected Zones**

There are no designated protected zones.

**H4.6. Connections**

There are no additional requirements beyond Section H4.5.

**H4.6a. Demand Critical Welds**

There are no requirements for demand critical welds.

**H5. COMPOSITE SPECIAL SHEAR WALLS (C-SSW)**

**H5.1. Scope**

Composite special shear walls (C-SSW) shall be designed in conformance with this section. This section is applicable when reinforced concrete walls are composite with structural steel elements, including structural steel or composite sections acting as boundary members for the walls and structural steel or composite coupling beams that connect two or more adjacent reinforced concrete walls.

**H5.2. Basis of Design**

C-SSW designed in accordance with these provisions are expected to provide significant inelastic deformation capacity through yielding in the reinforced concrete walls and the steel or composite elements. Reinforced concrete wall elements shall be designed to provide inelastic deformations at the design story drift consistent with ACI 318 including Chapter 18. Structural steel and composite coupling beams shall be designed to provide inelastic deformations at the design story drift through yielding in flexure or shear. Coupling beam connections and the design of the walls shall be designed to account for the expected strength including strain hardening in the coupling beams. Structural steel and composite boundary elements shall be designed to provide inelastic deformations at the design story drift through yielding due to axial force.

C-SSW systems shall satisfy the requirements of Section H4 and the shear wall requirements of ACI 318 including Chapter 18, except as modified in this section.

**User Note:** Steel coupling beams can be proportioned to be shear-critical or flexural-critical. Coupling beams with lengths $g \leq 1.6M_p/V_p$ can be
assumed to be shear-critical, where \( g, M_p, \) and \( V_p \) are defined in Section H4.5b(1). Coupling beams with lengths \( g \geq 2.6 \frac{M_p}{V_p} \) may be considered to be flexure-critical. Coupling beam lengths between these two values are considered to yield in flexure and shear simultaneously.

**H5.3. Analysis**

Analysis requirements of Section H4.3 shall be met with the following exceptions:

(a) Cracked effective stiffness values for elastic analysis shall be assigned in accordance with ACI 318 Chapter 6 practice for wall piers and composite coupling beams.

(b) Effects of shear distortion of the steel coupling beam shall be taken into account.

**H5.4. System Requirements**

In addition to the system requirements of Section H4.4, the following shall be satisfied:

(a) In coupled walls, coupling beams shall yield over the height of the structure followed by yielding at the base of the wall piers.

(b) In coupled walls, the axial design strength of the wall at the balanced condition, \( P_b \), shall equal or exceed the total required compressive axial strength in a wall pier, computed as the sum of the required strengths attributed to the walls from the gravity load components of the lateral load combination plus the sum of the expected beam shear strengths increased by a factor of 1.1 to reflect the effects of strain hardening of all the coupling beams framing into the walls.

**H5.5. Members**

**H5.5a. Ductile Elements**

Welding on steel coupling beams is permitted for attachment of stiffeners, as required in Section F3.5b.4.

**H5.5b. Boundary Members**

Unencased structural steel columns shall satisfy the requirements of Section D1.1 for highly ductile members and Section H4.5a(a).

In addition to the requirements of Sections H4.3(b) and H4.5a(b), the requirements in this section shall apply to walls with concrete-encased structural steel boundary members. Concrete-encased structural steel
boundary members that qualify as composite columns in Specification Chapter I shall meet the highly ductile member requirements of Section D1.4b(b). Otherwise, such members shall be designed as composite compression members to satisfy the requirements of ACI 318 including the special seismic requirements for boundary members in ACI 318 Section 18.10.6. Transverse reinforcement for confinement of the composite boundary member shall extend a distance of 2\(h\) into the wall, where \(h\) is the overall depth of the boundary member in the plane of the wall.

Headed studs or welded reinforcing anchors shall be provided as specified in Section H4.5a(c).

Vertical wall reinforcement as specified in Section H4.5b.1(d) shall be confined by transverse reinforcement that meets the requirements for boundary members of ACI 318 Section 18.10.6.

**H5.5c. Steel Coupling Beams**

The design and detailing of steel coupling beams shall satisfy the following:

(a) The embedment length, \(L_e\), of the coupling beam shall be computed from Equations H5-1 and H5-1M.

\[
V_n = 1.54 \sqrt{f_y \left(\frac{b_y}{b_f}\right)^{0.66}} \beta_i b_j L_e \left[\frac{0.58 - 0.22\beta_i}{0.88 + \frac{g}{2L_e}}\right] \quad \text{(H5-1)}
\]

\[
V_n = 4.04 \sqrt{f_y \left(\frac{b_y}{b_f}\right)^{0.66}} \beta_i b_j L_e \left[\frac{0.58 - 0.22\beta_i}{0.88 + \frac{g}{2L_e}}\right] \quad \text{(H5-1M)}
\]

where

\[L_e = \text{coupling beam embedment length considered to begin inside the first layer of confining reinforcement in the wall boundary member, in (mm)}\]

\[g = \text{clear span of the coupling beam plus the wall concrete cover at each end of the beam, in (mm)}\]

\[V_n = \text{expected beam shear strength computed from Equation H5-2, kips (N)}\]
1. Structural steel coupling beams shall satisfy the requirements of Section F3.5b, except that for built-up cross sections, the flange-to-web welds are permitted to be made with two-sided fillet, partial-joint-penetration, or complete-joint-penetration groove welds that develop the expected strength of the beam. When required in Section F3.5b.4, the coupling beam rotation shall be assumed as a 0.08 rad link rotation unless a smaller value is justified by rational analysis of the inelastic deformations that are expected under the design story drift. Face bearing plates shall be provided on both sides of the coupling beams at the face of the reinforced concrete wall. These stiffeners shall meet the detailing requirements of Section F3.5b.4.

2. Steel coupling beams shall comply with the requirements of Section D1.1 for highly ductile members. Flanges of coupling beams with I-shaped sections with $g \leq 1.6 M_p/V_p$ are permitted to satisfy the requirements for moderately ductile members.

3. Embedded steel members shall be provided with two regions of vertical transfer reinforcement attached to both the top and bottom flanges of the embedded member. The first region shall be located to coincide with the location of longitudinal wall reinforcing bars closest to the face of the wall. The second shall be placed a distance no less than $d/2$ from the termination of the embedment length. All transfer reinforcement bars shall be fully developed where they engage the coupling beam flanges. It is permitted to use straight, hooked or mechanical anchorage to provide development. It is permitted to use mechanical couplers welded to the flanges to attach the vertical transfer bars. The area of vertical transfer reinforcement required is computed by Equation H5-1:
\[ A_{tb} \geq 0.03 f'_{c} L_{e} b_{f} / F_{y sr} \quad (H5-1) \]

where

\[ A_{tb} = \text{area of transfer reinforcement required in each of the first} \]
\[ \text{and second regions attached to each of the top and bottom} \]
\[ \text{flanges, in.}^2 (\text{mm}^2) \]

\[ F_{y sr} = \text{specified minimum yield stress of transfer reinforcement,} \]
\[ \text{ksi (MPa)} \]

\[ L_{e} = \text{embedment length, in. (mm)} \]

\[ b_{f} = \text{beam flange width, in. (mm)} \]

\[ f'_{c} = \text{concrete compressive strength, ksi (MPa)} \]

The area of vertical transfer reinforcement shall not exceed that
computed by Equation H5-2:

\[ \sum A_{tb} < 0.08 L_{e} b_{w} - A_{sr} \quad (H5-2) \]

where

\[ \Sigma A_{tb} = \text{total area of transfer reinforcement provided in both the} \]
\[ \text{first and second regions attached to either the top or} \]
\[ \text{bottom flange, in.}^2 (\text{mm}^2) \]

\[ A_{sr} = \text{area of longitudinal wall reinforcement provided over} \]
\[ \text{the embedment length, } L_{w}, \text{in.}^2 (\text{mm}^2) \]

\[ b_{w} = \text{width of wall, in. (mm)} \]

**H5.5d. Composite Coupling Beams**

Encased composite sections serving as coupling beams shall satisfy the
requirements of Section H5.5c except the requirements of Section
F3.5b.4 need not be met, and Equation H5-3 shall be used instead of
Equation H4-2. For all encased composite coupling beams, the limiting
expected shear strength, \( V_{\text{comp}} \), is:

\[
V_{\text{comp}} = 1.1 R_{y} V_{p} + 0.08 \sqrt{R_{c} f'_{c}} b_{w} d_{c} + \frac{1.33 R_{yr} A_{s} F_{y sr} d_{c}}{s} \quad (H5-3) \\
V_{\text{comp}} = 1.1 R_{y} V_{p} + 0.21 \sqrt{R_{c} f'_{c}} b_{w} d_{c} + \frac{1.33 R_{yr} A_{s} F_{y sr} d_{c}}{s} \quad (S.I.) \quad (H5-3M)
\]

Where

\[ F_{y sr} = \text{yield stress of transverse reinforcement, ksi (MPa)} \]

\[ R_{c} = \text{factor to account for expected strength of concrete = 1.5} \]

\[ R_{yr} = \text{ratio of the expected yield stress of the transverse} \]
reinforcement material to the specified minimum yield stress, $F_{yue}$

H5.5e. Protected Zones

The clear span of the coupling beam between the faces of the shear walls shall be designated as a protected zone, and shall satisfy the requirements of Section D1.3. Attachment of stiffeners as required by H5.5c(b) shall be permitted.

H5.6. Connections

H5.6a. Demand Critical Welds

The following welds are demand critical welds, and shall satisfy the requirements of Section A3.4b and I2.3:

(a) Groove welds at column splices

(b) Welds at the column-to-base plate connections

Exception: Where it can be shown that column hinging at, or near, the base plate is precluded by conditions of restraint, and in the absence of net tension under load combinations including the overstrength seismic load, demand critical welds are not required.

H5.6b. Column Splices

Column splices shall be designed following the requirements of Section G2.6f.

H6. COMPOSITE PLATE SHEAR WALLS – CONCRETE ENCASED (C-PSW/CE)

H6.1. Scope

Composite plate shear walls-concrete encased (C-PSW/CE) shall be designed in conformance with this section. C-PSW/CE consist of steel plates with reinforced concrete encasement on one or both sides of the plate and structural steel or composite boundary members.

H6.2. Basis of Design

C-PSW/CE designed in accordance with these provisions are expected to provide significant inelastic deformation capacity through yielding in the plate webs. The horizontal boundary elements (HBEs) and vertical boundary elements (VBEs) adjacent to the composite webs shall be designed to remain essentially elastic under the maximum forces that can be generated by the fully yielded steel webs along with the reinforced
concrete webs after the steel web has fully yielded, except that plastic hinging at the ends of HBEs is permitted.

H6.3. Analysis

H6.3a. Webs

The analysis shall account for openings in the web.

H6.3b. Other Members and Connections

Columns, beams and connections in C-PSW/CE shall be designed to resist seismic forces determined from an analysis that includes the expected strength of the steel webs in shear, \(0.6R_yF_yA_{sp}\), where \(A_{sp}\) is the horizontal area of the stiffened steel plate, in.\(^2\) (mm\(^2\)), and any reinforced concrete portions of the wall active at the design story drift. The VBEs are permitted to yield at the base.

H6.4. System Requirements

H6.4a. Steel Plate Thickness

Steel plates with thickness less than 3/8 in. (9.5 mm) are not permitted.

H6.4b. Stiffness of Vertical Boundary Elements

The VBEs shall satisfy the requirements of Section F5.4a.

H6.4c. HBE-to-VBE Connection Moment Ratio

The beam-column moment ratio shall satisfy the requirements of Section F5.4b.

H6.4d. Bracing

HBE shall be braced to satisfy the requirements for moderately ductile members.

H6.4e. Openings in Webs

Boundary members shall be provided around openings in shear wall webs as required by analysis.

H6.5. Members

H6.5a. Basic Requirements

Steel and composite HBE and VBE shall satisfy the requirements of Section D1.1 for highly ductile members.
5664 **H6.5b. Webs**

5665 The design shear strength, $\phi V_n$, or the allowable shear strength, $V_n/\Omega$, for the limit state of shear yielding with a composite plate conforming to Section H6.5c shall be taken as:

5666 $V_n = 0.6 A_s p F_y$  

5667 $\phi = 0.90$ (LRFD)  

5668 $\Omega = 1.67$ (ASD)

5670 where

5671 $F_y = \text{specified minimum yield stress of the plate, ksi (MPa)}$

5672 $V_n = \text{nominal shear strength of the steel plate, kips (N)}$

5673 The available shear strength of C-PSW/CE with a plate that does not meet the stiffening requirements in Section H6.5c shall be based upon the strength of the plate as given in Section F5.5 and shall satisfy the requirements of *Specification* Sections G2 and G3.

5677 **H6.5c. Concrete Stiffening Elements**

5678 The steel plate shall be stiffened by encasement or attachment to a reinforced concrete panel. Conformance to this requirement shall be demonstrated with an elastic plate buckling analysis showing that the composite wall is able to resist a nominal shear force equal to $V_n$, as determined in Section H6.5b.

5683 The concrete thickness shall be a minimum of 4 in. (100 mm) on each side when concrete is provided on both sides of the steel plate and 8 in. (200 mm) when concrete is provided on one side of the steel plate. Steel headed stud anchors or other mechanical connectors shall be provided to prevent local buckling and separation of the plate and reinforced concrete. Horizontal and vertical reinforcement shall be provided in the concrete encasement to meet or exceed the requirements in ACI 318 Section 11.6 and 11.7. The reinforcement ratio in both directions shall not be less than 0.0025. The maximum spacing between bars shall not exceed 18 in. (450 mm).

5693 **H6.5d. Boundary Members**

5694 Structural steel and composite boundary members shall be designed to resist the expected shear strength of steel plate and any reinforced concrete portions of the wall active at the design story drift. Composite and reinforced concrete boundary members shall also satisfy the requirements of Section H5.5b. Steel boundary members shall also satisfy the requirements of Section F5.

5700 **H6.5e. Protected Zones**
There are no designated protected zones.

H6.6. Connections

H6.6a. Demand Critical Welds

The following welds are demand critical welds, and shall satisfy the requirements of Section A3.4b and I2.3:

(a) Groove welds at column splices

(b) Welds at the column-to-base plate connections

Exception: Where it can be shown that column hinging at, or near, the base plate is precluded by conditions of restraint, and in the absence of net tension under load combinations including the overstrength seismic load, demand critical welds are not required.

(c) Welds at HBE-to-VBE connections

H6.6b. HBE-to-VBE Connections

HBE-to-VBE connections shall satisfy the requirements of Section F5.6b.

H6.6c. Connections of Steel Plate to Boundary Elements

The steel plate shall be continuously welded or bolted on all edges to the structural steel framing and/or steel boundary members, or the steel component of the composite boundary members. Welds and/or slip-critical high-strength bolts required to develop the nominal shear strength of the plate shall be provided.

H6.6d. Connections of Steel Plate to Reinforced Concrete Panel

The steel anchors between the steel plate and the reinforced concrete panel shall be designed to prevent its overall buckling. Steel anchors shall be designed to satisfy the following conditions:

(a) Tension in the Connector

The steel anchor shall be designed to resist the tension force resulting from inelastic local buckling of the steel plate.

(b) Shear in the Connector

The steel anchors collectively shall be designed to transfer the expected strength in shear of the steel plate or reinforced concrete panel, whichever is smaller.

H6.6e. Column Splices
In addition to the requirements of Section D2.5, column splices shall comply with the requirements of this section. Where welds are used to make the splice, they shall be complete-joint-penetration groove welds. When column splices are not made with groove welds, they shall have a required flexural strength that is at least equal to the nominal flexural strength, $M_{pce}$, of the smaller composite column. The required shear strength of column web splices shall be at least equal to $\sum M_{pce}/H$, where $\sum M_{pce}$ is the sum of the nominal flexural strengths at the top and bottom ends of the composite column. For composite columns, the nominal flexural strength shall satisfy the requirements of Specification Chapter I with consideration of the required axial strength, $P_{rc}$.

H7. COMPOSITE PLATE SHEAR WALLS—CONCRETE FILLED (C-PSW/CF)

H7.1. Scope

Composite plate shear walls-concrete filled (C-PSW/CF) shall be designed in conformance with this section. This section is applicable to composite plate shear walls that consist of two planar steel web plates with concrete fill between the plates, with or without boundary elements. Composite action between the plates and concrete fill shall be achieved using either tie bars or a combination of tie bars and shear studs. The two steel web plates shall be of equal thickness and shall be placed at a constant distance from each other and connected using tie bars. When boundary elements are included, they shall be either half circular steel section of diameter equal to the distance between the two web plates or a circular concrete-filled steel tube.

H7.2. Basis of Design

C-PSW/CF with boundary elements, designed in accordance with these provisions, are expected to provide significant inelastic deformation capacity through developing plastic moment strength of the composite C-PSW/CF cross section, by yielding of the entire skin plate and the concrete attaining its compressive strength. The cross section shall be detailed such that it is able to attain its plastic moment strength. Shear yielding of the steel web skin plates shall not be the governing mechanism.

C-PSW/CF without boundary elements designed in accordance to these provisions are expected to provide inelastic deformation capacity by developing yield moment strength of the composite C-PSW/CF cross section, by flexural tension yielding of the steel plates. The walls shall be
detailed such that flexural compression yielding occurs before local buckling of the steel plates.

**H7.3. Analysis**

Analysis shall satisfy the following:

(a) Effective flexural stiffness of the wall shall be calculated per *Specification* Equation I2-12, with $C_3$ taken equal to 0.40.

(b) The shear stiffness of the wall shall be calculated using the shear stiffness of the composite cross section.

**H7.4. System Requirements**

**H7.4a. Steel Web Plate of C-PSW/CF with Boundary Elements**

The minimum thickness of the steel web plate shall be:

$$t_{\text{min}} = 0.55w_1 \sqrt{\frac{F_y}{E}}$$

where

- $w_1$ = maximum spacing of tie bars in vertical and horizontal directions, in. (mm)

When tie bars are welded with the web plate, the thickness of the plate shall develop the tension strength of the tie bars.

**H7.4b. Steel Plate of C-PSW/CF without Boundary Elements**

The minimum thickness of the steel plates shall be:

$$t_{\text{min}} = 1.0w_1 \sqrt{\frac{F_y}{E}}$$

where

- $w_1$ = maximum spacing of tie bars or shear studs in the vertical and horizontal directions, in. (mm)

**H7.4c. Half Circular or Full Circular End of C-PSW/CF with Boundary Elements**

The $D/t_{\text{HSS}}$ ratio for the circular part of the C-PSW/CF cross section shall conform to:
CHAPTER H

\[ \frac{D}{t_{\text{HSS}}} \leq 0.044 \frac{E}{F_y} \]  \hspace{1cm} (H7-3)

where
\[ D = \text{outside diameter of round HSS, in. (mm)} \]
\[ t_{\text{HSS}} = \text{thickness of HSS, in. (mm)} \]

H7.4d. Spacing of Tie Bars in C-PSW/CF with or without Boundary Elements

Tie bars shall be distributed in both vertical and horizontal directions.

H7.4e. Tie Bar Diameter in C-PSW/CF with or without Boundary Elements

Tie bars shall be designed to elastically resist the tension force, \( T_{\text{req}} \), equal to:
\[ T_{\text{req}} = T_1 + T_2 \]  \hspace{1cm} (H7-4)

\( T_1 \) is the tension force resulting from the locally buckled web plates developing plastic hinges on horizontal yield lines along the tie bars and at mid-vertical distance between tie-bars, and is determined as follows:
\[ T_1 = 2 \left( \frac{w_2}{w_1} \right) t_s^2 F_y \text{plate} \]  \hspace{1cm} (H7-5)

where
\[ t_s = \text{the thickness of steel web plate provided, in. (mm)} \]
\[ w_1, w_2 = \text{vertical and horizontal spacing of tie bars, in. (mm)}, \text{respectively} \]

\( T_2 \) is the tension force that develops to prevent splitting of the concrete element on a plane parallel to the steel plate.

\[ T_2 = \left( \frac{t_s F_y \text{plate} t_w}{4} \right) \left( \frac{w_2}{w_1} \right) \left[ \frac{6}{18 \left( \frac{t_w}{w_{\text{min}}} \right)^2 + 1} \right] \]  \hspace{1cm} (H7-6)

where
\[ t_w = \text{total thickness of wall, in. (mm)} \]
\[ w_{\text{min}} = \text{minimum of } w_1 \text{ and } w_2, \text{in. (mm)} \]

H7.4f. Connection between Tie Bars and Steel Plates

Connection of the tie bars to the steel plate shall be able to develop the full tension strength of the tie bar.
H7.4g. Connection between C-PSW/CF Steel Components

Welds between the steel web plate and the half-circular or full-circular ends of the cross section shall be complete-joint-penetration groove welds.

H7.4h. C-PSW/CF and Foundation Connection

The connection between C-PSW/CF and the foundation shall be detailed such that the connection is able to transfer the base shear force and the axial force acting together with the overturning moment, corresponding to 1.1 times the plastic composite flexural strength of the wall, where the plastic flexural composite strength is obtained by the plastic stress distribution method described in Specification Section I1.2a assuming that the steel components have reached a stress equal to the expected yield strength, $R_y F_y$, in either tension or compression and that concrete components in compression due to axial force and flexure have reached a stress of $f'_c$.

H7.5. System Requirements

H7.5a Flexural Strength

The nominal plastic moment strength of the C-PSW/CF with boundary elements shall be calculated considering that all the concrete in compression has reached its specified compressive strength, $f'_c$, and that the steel in tension and compression has reached its specified minimum yield strength, $F_y$, as determined based on the location of the plastic neutral axis.

The nominal moment strength of the C-PSW/CF without boundary elements shall be calculated as the yield moment, $M_y$, corresponding to yielding of the steel plate in flexural tension and first yield in flexural compression. The strength at first yield shall be calculated assuming a linear elastic stress distribution with maximum concrete compressive stress limited to 0.7 $f'_c$ and maximum steel stress limited to $F_y$.

User Note: The definition and calculation of the yield moment, $M_y$, for C-PSW/CF without boundary elements is very similar to the definition and calculation of yield moment, $M_y$, for noncompact filled composite members in Specification Section I3.4b(b).

H7.5b Shear Strength

The available shear strength of C-PSW/CF shall be determined as follows:
The design shear strength, $\phi V_n$, or the allowable shear strength, $V_n/\Omega$, of the C-PSW/CF with boundary elements shall be determined as follows:

$$V_n = \kappa F_y A_{sw}$$  \hspace{1cm} (H7-7)

$$\phi_v = 0.90 \text{ (LRFD)} \quad \Omega_v = 1.67 \text{ (ASD)}$$

where

$$\kappa = 1.11 - 5.16 \bar{\rho} \leq 1.0$$  \hspace{1cm} (H7-8)

$$\bar{\rho} = \text{strength adjusted reinforcement ratio}$$

$$= \frac{A_{yw} F_{yw}}{A_{cw} \sqrt{1,000 f'_c}}$$  \hspace{1cm} (H7-9)

$$= \frac{1}{12} \frac{A_{yw} F_{yw}}{A_{cw} \sqrt{f'_c}}$$  \hspace{1cm} (H7-9M)

$F_{yw}$ = specified minimum yield stress of web skin plates, ksi (MPa)

$f'_c$ = specified compressive strength of concrete, ksi (MPa)

$A_{sw}$ = area of steel web plates, in.$^2$ (mm$^2$)

$A_{cw}$ = area of concrete between web plates, in.$^2$ (mm$^2$)

**User Note:** For most cases, $0.9 \leq \kappa \leq 1.0$.

The nominal shear strength of the C-PSW/CF without boundary elements shall be calculated for the steel plates alone, in accordance with Section D1.4c.
CHAPTER I

FABRICATION AND ERECTION

This chapter addresses requirements for fabrication and erection.

**User Note:** All requirements of *Specification* Chapter M also apply, unless specifically modified by these Provisions.

The chapter is organized as follows:

I1. Shop and Erection Drawings
I2. Fabrication and Erection

I1. SHOP AND ERECTION DRAWINGS

I1.1. Shop Drawings for Steel Construction

Shop drawings shall indicate the work to be performed, and include items required by the *Specification*, the AISC Code of Standard Practice for Steel Buildings and Bridges, the applicable building code, the requirements of Sections A4.1 and A4.2, and the following, as applicable:

(a) Locations of pretensioned bolts
(b) Locations of Class A, or higher, faying surfaces
(c) Gusset plates drawn to scale when they are designed to accommodate inelastic rotation
(d) Weld access hole dimensions, surface profile and finish requirements
(e) Nondestructive testing (NDT) where performed by the fabricator

I1.2. Erection Drawings for Steel Construction

Erection drawings shall indicate the work to be performed, and include items required by the *Specification*, the AISC Code of Standard Practice for Steel Buildings and Bridges, the applicable building code, the requirements of Sections A4.1 and A4.2, and the following, as applicable:

(a) Locations of pretensioned bolts
(b) Those joints or groups of joints in which a specific assembly order, welding sequence, welding technique or other special precautions are required

I1.3. Shop and Erection Drawings for Composite Construction
Shop drawings and erection drawings for the steel components of composite steel-concrete construction shall satisfy the requirements of Sections I1.1 and I1.2. The shop drawings and erection drawings shall also satisfy the requirements of Section A4.3.

User Note: For reinforced concrete and composite steel-concrete construction, the provisions of ACI 315 *Details and Detailing of Concrete Reinforcement* and ACI 315-R *Manual of Engineering and Placing Drawings for Reinforced Concrete Structures* apply.

### I2. FABRICATION AND ERECTION

#### I2.1. Protected Zone

A protected zone designated by these Provisions or ANSI/AISC 358 shall comply with the following requirements:

(a) Within the protected zone, holes, tack welds, erection aids, air-arc gouging, and unspecified thermal cutting from fabrication or erection operations shall be repaired as required by the engineer of record.

(b) Steel headed stud anchors shall not be placed on beam flanges within the protected zone.

(c) Arc spot welds as required to attach decking are permitted.

(d) Decking attachments that penetrate the beam flange shall not be placed on beam flanges within the protected zone, except powder actuated fasteners up to 0.18 in. diameter are permitted.

(e) Welded, bolted, screwed or shot-in attachments for perimeter edge angles, exterior facades, partitions, duct work, piping or other construction shall not be placed within the protected zone. Exception: Other attachments are permitted where designated or approved by the engineer of record. See Section D1.3.

User Note: AWS D1.8/D1.8M clause 6.15 contains requirements for weld removal and the repair of gouges and notches in the protected zone.

#### I2.2. Bolted Joints

Bolted joints shall satisfy the requirements of Section D2.2.
I2.3.  Welded Joints

Welding and welded connections shall be in accordance with *Structural Welding Code—Steel* (AWS D1.1/D1.1M), hereafter referred to as AWS D1.1/D1.1M, and AWS D1.8/D1.8M.

Welding procedure specifications (WPSs) shall be approved by the engineer of record.

Weld tabs shall be in accordance with AWS D1.8/D1.8M clause 6.10, except at the outboard ends of continuity-plate-to-column welds, weld tabs and weld metal need not be removed closer than ¼ in. (6 mm) from the continuity plate edge.

AWS D1.8/D1.8M clauses relating to fabrication shall apply equally to shop fabrication welding and to field erection welding.

**User Note:** AWS D1.8/D1.8M was specifically written to provide additional requirements for the welding of seismic force resisting systems, and has been coordinated wherever possible with these Provisions. AWS D1.8/D1.8M requirements related to fabrication and erection are organized as follows, including normative (mandatory) annexes:

(a) General Requirements  
(b) Reference Documents  
(c) Definitions  
(d) Welded Connection Details  
(e) Welder Qualification  
(f) Fabrication  

Annex A.  WPS Heat Input Envelope Testing of Filler Metals for Demand Critical Welds  
Annex B.  Intermix CVN Testing of Filler Metal Combinations (where one of the filler metals is FCAW-S)  
Annex C.  Supplemental Welder Qualification for Restricted Access Welding  
Annex D.  Supplemental Testing for Extended Exposure Limits for FCAW Filler Metals

AWS D1.8/D1.8M requires the complete removal of all weld tab material, leaving only base metal and weld metal at the edge of the joint. This is to remove any weld discontinuities at the weld ends, as well as facilitate magnetic particle testing (MT) of this area. At continuity plates, these Provisions permit a limited amount of weld tab material to remain because of the reduced strains at continuity plates, and any remaining weld discontinuities in this weld end region would likely be of little
significance. Also, weld tab removal sites at continuity plates are not subjected to MT.

AWS D1.8/D1.8M clause 6 is entitled “Fabrication,” but the intent of AWS is that all provisions of AWS D1.8/D1.8M apply equally to fabrication and erection activities as described in the Specification and in these Provisions.

### 12.4. Continuity Plates and Stiffeners

Corners of continuity plates and stiffeners placed in the webs of rolled shapes shall be detailed in accordance with AWS D1.8 clause 4.1.
CHAPTER J

QUALITY CONTROL AND QUALITY ASSURANCE

This chapter addresses requirements for quality control and quality assurance.

User Note: All requirements of Specification Chapter N also apply, unless specifically modified by these Provisions.

The chapter is organized as follows:

J1. Scope
J2. Fabricator and Erector Documents
J3. Quality Assurance Agency Documents
J4. Inspection and Nondestructive Testing Personnel
J5. Inspection Tasks
J6. Welding Inspection and Nondestructive Testing
J7. Inspection of High-Strength Bolting
J8. Other Steel Structure Inspections
J9. Inspection of Composite Structures
J10. Inspection of Piling

J1. SCOPE

Quality Control (QC) as specified in this chapter shall be provided by the fabricator, erector or other responsible contractor as applicable. Quality Assurance (QA) as specified in this chapter shall be provided by others when required by the authority having jurisdiction (AHJ), applicable building code (ABC), purchaser, owner or engineer of record (EOR). Nondestructive testing (NDT) shall be performed by the agency or firm responsible for Quality Assurance, except as permitted in accordance with Specification Section N7.

User Note: The quality assurance plan of this section is considered adequate and effective for most seismic force resisting systems and should be used without modification. The quality assurance plan is intended to ensure that the seismic force resisting system is significantly free of defects that would greatly reduce the ductility of the system. There may be cases (for example, nonredundant major transfer members, or where work is performed in a location that is difficult to access) where supplemental testing might be advisable. Additionally, where the fabricator's or erector's quality control program has demonstrated the capability to perform some tasks this plan has assigned to quality assurance, modification of the plan could be considered.
J2. FABRICATOR AND ERECTOR DOCUMENTS

J2.1. Documents to be Submitted for Steel Construction

In addition to the requirements of Specification Section N3.1, the following documents shall be submitted for review by the EOR or the EOR’s designee, prior to fabrication or erection of the affected work, as applicable:

(a) Welding procedure specifications (WPS)

(b) Copies of the manufacturer’s typical certificate of conformance for all electrodes, fluxes and shielding gases to be used

(c) For demand critical welds, applicable manufacturer’s certifications that the filler metal meets the supplemental notch toughness requirements, as applicable. When the filler metal manufacturer does not supply such supplemental certifications, the fabricator or erector, as applicable, shall have the necessary testing performed and provide the applicable test reports

(d) Manufacturer’s product data sheets or catalog data for SMAW, FCAW and GMAW composite (cored) filler metals to be used

(e) Bolt installation procedures

(d) Specific assembly order, welding sequence, welding technique, or other special precautions for joints or groups of joints where such items are designated to be submitted to the engineer of record

J2.2. Documents to be Available for Review for Steel Construction

Additional documents as required by the EOR in the contract documents shall be available by the fabricator and erector for review by the EOR or the EOR’s designee prior to fabrication or erection, as applicable.

The fabricator and erector shall retain their document(s) for at least one year after substantial completion of construction.

J2.3. Documents to be Submitted for Composite Construction

The following documents shall be submitted by the responsible contractor for review by the EOR or the EOR’s designee, prior to concrete production or placement, as applicable:

(a) Concrete mix design and test reports for the mix design
J2.4. Documents to be Available for Review for Composite Construction

The following documents shall be available from the responsible contractor for review by the EOR or the EOR’s designee prior to fabrication or erection, as applicable, unless specified to be submitted:

(a) Material test reports for reinforcing steel
(b) Inspection procedures
(c) Nonconformance procedure
(d) Material control procedure
(e) Welder performance qualification records (WPQR) as required by AWS D1.4/D1.4M
(f) QC Inspector qualifications

The responsible contractor shall retain their document(s) for at least one year after substantial completion of construction.

J3. QUALITY ASSURANCE AGENCY DOCUMENTS

The agency responsible for quality assurance shall submit the following documents to the authority having jurisdiction, the EOR, and the owner or owner’s designee:

(a) QA agency’s written practices for the monitoring and control of the agency’s operations. The written practice shall include:

(1) The agency's procedures for the selection and administration of inspection personnel, describing the training, experience and examination requirements for qualification and certification of inspection personnel, and
(2) The agency’s inspection procedures, including general inspection, material controls, and visual welding inspection

(b) Qualifications of management and QA personnel designated for
(c) Qualification records for inspectors and NDT technicians designated for the project

(d) NDT procedures and equipment calibration records for NDT to be performed and equipment to be used for the project

(e) For composite construction, concrete testing procedures and equipment

J4. INSPECTION AND NONDESTRUCTIVE TESTING PERSONNEL

In addition to the requirements of Specification Sections N4.1 and N4.2, visual welding inspection and NDT shall be conducted by personnel qualified in accordance with AWS D1.8/D1.8M clause 7.2. In addition to the requirements of Specification Section N4.3, ultrasonic testing technicians shall be qualified in accordance with AWS D1.8/D1.8M clause 7.2.4.

User Note: The recommendations of the International Code Council Model Program for Special Inspection should be considered a minimum requirement to establish the qualifications of a bolting inspector.

J5. INSPECTION TASKS

Inspection tasks and documentation for QC and QA for the seismic force resisting system (SFRS) shall be as provided in the tables in Sections J6, J7, J8, J9 and J10. The following entries are used in the tables:

J5.1. Observe (O)

The inspector shall observe these functions on a random, daily basis. Operations need not be delayed pending observations.

J5.2. Perform (P)

These inspections shall be performed prior to the final acceptance of the item.

J5.3. Document (D)

The inspector shall prepare reports indicating that the work has been performed in accordance with the contract documents. The report need not provide detailed measurements for joint fit-up, WPS settings,
completed welds, or other individual items listed in the tables. For shop
fabrication, the report shall indicate the piece mark of the piece inspected.
For field work, the report shall indicate the reference grid lines and floor
or elevation inspected. Work not in compliance with the contract
documents and whether the noncompliance has been satisfactorily
repaired shall be noted in the inspection report.

J5.4. Coordinated Inspection

Where a task is stipulated to be performed by both QC and QA, coordination of the inspection function between QC and QA is permitted in accordance with Specification Section N5.3.

J6. WELDING INSPECTION AND NONDESTRUCTIVE TESTING

Welding inspection and nondestructive testing shall satisfy the requirements of the Specification, this section and AWS D1.8/D1.8M.

User Note: AWS D1.8/D1.8M was specifically written to provide additional requirements for the welding of seismic force resisting systems, and has been coordinated when possible with these Provisions. AWS D1.8/D1.8M requirements related to inspection and nondestructive testing are organized as follows, including normative (mandatory) annexes:

1. General Requirements
7. Inspection
Annex F. Supplemental Ultrasonic Technician Testing
Annex G. Supplemental Magnetic Particle Testing Procedures
Annex H. Flaw Sizing by Ultrasonic Testing

J6.1. Visual Welding Inspection

All requirements of the Specification shall apply, except as specifically modified by AWS D1.8/D1.8M.

Visual welding inspection shall be performed by both quality control and quality assurance personnel. As a minimum, tasks shall be as listed in Tables J6-1, J6-2 and J6-3.

*When welding of doubler plates, continuity plates or stiffeners has been performed in the k-area, visually inspect the web k-area for cracks within 3 in. (75 mm) of the weld. The visual inspection shall be performed no sooner than 48 hours following completion of the welding.*

J6.2. NDT of Welded Joints

In addition to the requirements of Specification Section N5.5, nondestructive testing of welded joints shall be as required in this section:

J6.2a. CJP Groove Weld NDT

Ultrasonic testing (UT) shall be performed on 100% of CJP groove welds in materials 5/16 in. (8 mm) thick or greater. Ultrasonic testing in materials less than 5/16 in. (8 mm) thick is not required. Weld discontinuities shall be accepted or rejected on the basis of criteria of AWS D1.1/D1.1M Table 6.2. Magnetic particle testing shall be performed on 25% of all beam-to-column CJP groove welds. The rate of UT and MT is permitted to be reduced in accordance with Sections J6.2h and J6.2i, respectively.

Exception: For ordinary moment frames in structures in risk categories I or II, UT and MT of CJP groove welds are required only for demand critical welds.
User Note: For structures in Risk Category III or IV, AISC 360 section N5.5b requires that the UT be performed by QA on all CJP groove welds subject to transversely applied tension loading in butt, T- and corner joints, in material 5/16 in. (8 mm) thick or greater.

J6.2b. Column Splice and Column to Base Plate PJP Groove Weld NDT

UT shall be performed by QA on 100% of PJP groove welds in column splices and column to base plate welds.

Weld discontinuities shall be accepted or rejected on the basis of criteria of AWS D1.1/D1.1M Table 6.2. The rate of UT is permitted to be reduced in accordance with Section J6.2h.

User Note: In accordance with AWS D1.8 clause 7.10.5, when UT of PJP groove welded joints is required, rejection shall not be on the basis of the indication rating from the root area of the weld.

J6.2c. Base Metal NDT for Lamellar Tearing and Laminations

After joint completion, base metal thicker than 1½ in. (38 mm) loaded in tension in the through-thickness direction in tee and corner joints, where the connected material is greater than 1½ in. (19 mm) and contains CJP groove welds, shall be ultrasonically tested for discontinuities behind and adjacent to the fusion line of such welds. Any base metal discontinuities found within $t/4$ of the steel surface shall be accepted or rejected on the basis of criteria of AWS D1.1/D1.1M Table 6.2, where $t$ is the thickness of the part subjected to the through-thickness strain.

J6.2d. Beam Cope and Access Hole NDT

At welded splices and connections, thermally cut surfaces of beam copes and access holes shall be tested using magnetic particle testing or penetrant testing, when the flange thickness exceeds 1½ in. (38 mm) for rolled shapes, or when the web thickness exceeds 1½ in. (38 mm) for built-up shapes.

J6.2e. Reduced Beam Section Repair NDT

Magnetic particle testing shall be performed on any weld and adjacent area of the reduced beam section (RBS) cut surface that has been repaired by welding, or on the base metal of the RBS cut surface if a sharp notch has been removed by grinding.

J6.2f. Weld Tab Removal Sites

2016 Seismic Provisions for Structural Steel Buildings
PUBLIC REVIEW Draft Dated March 16, 2015
AMERICAN INSTITUTE OF STEEL CONSTRUCTION
At the end of welds where weld tabs have been removed, magnetic particle testing shall be performed on the same beam-to-column joints receiving UT as required under Section J6.2b. The rate of MT is permitted to be reduced in accordance with Section J6.2i. MT of continuity plate weld tabs removal sites is not required.

**J6.2g. Reduction of Percentage of Ultrasonic Testing**

The reduction of percentage of UT is permitted to be reduced in accordance with Specification Section N5.5e, except no reduction is permitted for demand critical welds.

**J6.2h. Reduction of Percentage of Magnetic Particle Testing**

The amount of MT on CJP groove welds is permitted to be reduced if approved by the engineer of record and the authority having jurisdiction. The MT rate for an individual welder or welding operator is permitted to be reduced to 10%, provided the reject rate is demonstrated to be 5% or less of the welds tested for the welder or welding operator. A sampling of at least 20 completed welds for a job shall be made for such reduction evaluation. Reject rate is the number of welds containing rejectable defects divided by the number of welds completed. This reduction is prohibited on welds in the k-area, at repair sites, backing removal sites, and access holes.

**J7. INSPECTION OF HIGH-STRENGTH BOLTING**

Bolting inspection shall satisfy the requirements of Specification Section N5.6 and this section. Bolting inspection shall be performed by both quality control and quality assurance personnel. As a minimum, the tasks shall be as listed in Tables J7-1, J7-2 and J7-3.

J9. INSPECTION OF COMPOSITE STRUCTURES

Where applicable, inspection of composite structures shall satisfy the requirements of the Specification and this section. These inspections shall be performed by the responsible contractor’s quality control personnel and by quality assurance personnel.

Where applicable, inspection of structural steel elements used in composite structures shall comply with the requirements of this Chapter. Where applicable, inspection of reinforced concrete shall comply with the requirements of ACI 318, and inspection of welded reinforcing steel shall comply with the applicable requirements of Section J6.1.

Where applicable to the type of composite construction, the minimum inspection tasks shall be as listed in Tables J9-1, J9-2 and J9-3.

TABLE J10-1
Inspection of H-Piles
CHAPTER K

PREQUALIFICATION AND CYCLIC QUALIFICATION TESTING

PROVISIONS

This chapter addresses requirements for qualification and prequalification testing.

This chapter is organized as follows:
- K1. Prequalification of Beam-to-Column and Link-to-Column Connections
- K2. Cyclic Tests for Qualification of Beam-to-Column and Link-to-Column Connections
- K3. Cyclic Tests for Qualification of Buckling Restrained Braces

K1. PREQUALIFICATION OF BEAM-TO-COLUMN AND LINK-TO-COLUMN CONNECTIONS

K1.1. Scope

This section contains minimum requirements for prequalification of beam-to-column moment connections in SMF, IMF, C-SMF, and C-IMF, and link-to-column connections in EBF. Prequalified connections are permitted to be used, within the applicable limits of prequalification, without the need for further qualifying cyclic tests. When the limits of prequalification or design requirements for prequalified connections conflict with the requirements of these Provisions, the limits of prequalification and design requirements for prequalified connections shall govern.

K1.2. General Requirements

K1.2a. Basis for Prequalification

Connections shall be prequalified based on test data satisfying Section K1.3, supported by analytical studies and design models. The combined body of evidence for prequalification must be sufficient to assure that the connection is able to supply the required story drift angle for SMF, IMF, C-SMF, and C-IMF systems, or the required link rotation angle for EBF, on a consistent and reliable basis within the specified limits of prequalification. All applicable limit states for the connection that affect the stiffness, strength and deformation capacity of the connection and the seismic force resisting system (SFRS) must be identified. The effect of design variables listed in Section K1.4 shall be addressed for connection prequalification.
K1.2b. Authority for Prequalification

Prequalification of a connection and the associated limits of prequalification shall be established by a connection prequalification review panel (CPRP) approved by the authority having jurisdiction.

K1.3. Testing Requirements

Data used to support connection prequalification shall be based on tests conducted in accordance with Section K2. The CPRP shall determine the number of tests and the variables considered by the tests for connection prequalification. The CPRP shall also provide the same information when limits are to be changed for a previously prequalified connection. A sufficient number of tests shall be performed on a sufficient number of nonidentical specimens to demonstrate that the connection has the ability and reliability to undergo the required story drift angle for SMF, IMF, C-SMF, and C-IMF and the required link rotation angle for EBF, where the link is adjacent to columns. The limits on member sizes for prequalification shall not exceed the limits specified in Section K2.3b.

K1.4. Prequalification Variables

In order to be prequalified, the effect of the following variables on connection performance shall be considered. Limits on the permissible values for each variable shall be established by the CPRP for the prequalified connection.

K1.4a. Beam and Column Parameters for SMF and IMF, Link and Column Parameters for EBF

(a) Cross-section shape: wide flange, box or other
(b) Cross-section fabrication method: rolled shape, welded shape or other
(c) Depth
(d) Weight per foot
(e) Flange thickness
(f) Material specification
(g) Beam span-to-depth ratio (for SMF or IMF), or link length (for EBF)
(h) Width-to-thickness ratio of cross-section elements
(i) Lateral bracing
(j) Column orientation with respect to beam or link: beam or link is connected to column flange, beam or link is connected to column web, beams or links are connected to both the column flange and web, or other

(k) Other parameters pertinent to the specific connection under consideration

K1.4b. Beam and Column Parameters for C-SMF and C-IMF

(a) For structural steel members that are part of a composite beam or column: specify parameters required in Section K1.4a.

(b) Overall depth of composite beam and column

(c) Composite beam span to depth ratio

(d) Reinforcing bar diameter

(e) Reinforcement material specification

(f) Reinforcement development and splice requirements

(g) Transverse reinforcement requirements

(h) Concrete compressive strength and density

(i) Steel anchor dimensions and material specification

(j) Other parameters pertinent to the specific connection under consideration

K1.4c. Beam-to-Column or Link-to-Column Relations

(a) Panel zone strength for SMF, IMF, and EBF

(b) Joint shear strength for C-SMF and C-IMF

(c) Doubler plate attachment details for SMF, IMF, and EBF

(d) Joint reinforcement details for C-SMF and C-IMF

(e) Column-to-beam (or column-to-link) moment ratio

K1.4d. Continuity and Diaphragm Plates

(a) Identification of conditions under which continuity plates or diaphragm plates are required

(b) Thickness, width and depth

(c) Attachment details
K1.4e. Welds

(a) Location, extent (including returns), type (CJP, PJP, fillet, etc.) and any reinforcement or contouring required

(b) Filler metal classification strength and notch toughness

(c) Details and treatment of weld backing and weld tabs

(d) Weld access holes: size, geometry and finish

(e) Welding quality control and quality assurance beyond that described in Chapter J, including NDT method, inspection frequency, acceptance criteria and documentation requirements

K1.4f. Bolts

(a) Bolt diameter

(b) Bolt grade: ASTM A325, A325M, A490, A490M or other

(c) Installation requirements: pretensioned, snug-tight or other

(d) Hole type: standard, oversize, short-slot, long-slot or other

(e) Hole fabrication method: drilling, punching, sub-punching and reaming, or other

(f) Other parameters pertinent to the specific connection under consideration

K1.4g. Reinforcement in C-SMF and C-IMF

(a) Location of longitudinal and transverse reinforcement

(b) Cover requirements

(c) Hook configurations and other pertinent reinforcement details

K1.4h. Quality Control and Quality Assurance

Requirements that exceed or supplement requirements specified in Chapter J, if any.

K1.4i. Additional Connection Details

All variables and workmanship parameters that exceed AISC, RCSC and AWS requirements pertinent to the specific connection under consideration, as established by the CPRP.

K1.5. Design Procedure
A comprehensive design procedure must be available for a prequalified connection. The design procedure must address all applicable limit states within the limits of prequalification.

K1.6. Prequalification Record

A prequalified connection shall be provided with a written prequalification record with the following information:

(a) General description of the prequalified connection and drawings that clearly identify key features and components of the connection

(b) Description of the expected behavior of the connection in the elastic and inelastic ranges of behavior, intended location(s) of inelastic action, and a description of limit states controlling the strength and deformation capacity of the connection

(c) Listing of systems for which connection is prequalified: SMF, IMF, EBF, C-SMF, or C-IMF.

(d) Listing of limits for all applicable prequalification variables listed in Section K1.4

(e) Listing of demand critical welds

(f) Definition of the region of the connection that comprises the protected zone

(g) Detailed description of the design procedure for the connection, as required in Section K1.5

(h) List of references of test reports, research reports and other publications that provided the basis for prequalification

(i) Summary of quality control and quality assurance procedures

K2. CYCLIC TESTS FOR QUALIFICATION OF BEAM-TO-COLUMN AND LINK-TO-COLUMN CONNECTIONS

K2.1. Scope

This section provides requirements for qualifying cyclic tests of beam-to-column moment connections in SMF, IMF, C-SMF, and C-IMF; and link-to-column connections in EBF, when required in these Provisions.

The purpose of the testing described in this section is to provide evidence that a beam-to-column connection or a link-to-column connection satisfies the requirements for strength and story drift angle or link...
rotation angle in these Provisions. Alternative testing requirements are permitted when approved by the engineer of record and the authority having jurisdiction.

### K2.2. Test Subassemblage Requirements

The test subassemblage shall replicate as closely as is practical the conditions that will occur in the prototype during earthquake loading. The test subassemblage shall include the following features:

(a) The test specimen shall consist of at least a single column with beams or links attached to one or both sides of the column.

(b) Points of inflection in the test assemblage shall coincide with the anticipated points of inflection in the prototype under earthquake loading.

(c) Lateral bracing of the test subassemblage is permitted near load application or reaction points as needed to provide lateral stability of the test subassemblage. Additional lateral bracing of the test subassemblage is not permitted, unless it replicates lateral bracing to be used in the prototype.

### K2.3. Essential Test Variables

The test specimen shall replicate as closely as is practical the pertinent design, detailing, construction features, and material properties of the prototype. The following variables shall be replicated in the test specimen.

### K2.3a. Sources of Inelastic Rotation

The inelastic rotation shall be computed based on an analysis of test specimen deformations. Sources of inelastic rotation include, but are not limited to, yielding of members, yielding of connection elements and connectors, yielding of reinforcing steel, inelastic deformation of concrete, and slip between members and connection elements. For beam-to-column moment connections in SMF, IMF, C-SMF, and C-IMF, inelastic rotation is computed based upon the assumption that inelastic action is concentrated at a single point located at the intersection of the centerline of the beam with the centerline of the column. For link-to-column connections in EBF, inelastic rotation shall be computed based upon the assumption that inelastic action is concentrated at a single point located at the intersection of the centerline of the link with the face of the column.

Inelastic rotation shall be developed in the test specimen by inelastic action in the same members and connection elements as anticipated in the prototype (in other words, in the beam or link, in the column panel zone,
in the column outside of the panel zone, or in connection elements) within the limits described below. The percentage of the total inelastic rotation in the test specimen that is developed in each member or connection element shall be within 25% of the anticipated percentage of the total inelastic rotation in the prototype that is developed in the corresponding member or connection element.

K2.3b. Members

The size of the beam or link used in the test specimen shall be within the following limits:

(a) The depth of the test beam or link shall be no less than 90% of the depth of the prototype beam or link.

(b) For SMF, IMF and EBF, the weight per foot of the test beam or link shall be no less than 75% of the weight per foot of the prototype beam or link.

(c) For C-SMF and C-IMF, the weight per foot of the structural steel member that forms part of the test beam shall be no less than 75% of the weight per foot of the structural steel member that forms part of the prototype beam.

The size of the column used in the test specimen shall correctly represent the inelastic action in the column, as per the requirements in Section K2.3a. In addition, in SMF, IMF, and EBF, the depth of the test column shall be no less than 90% of the depth of the prototype column. In C-SMF and C-IMF, the depth of the structural steel member that forms part of the test column shall be no less than 90% of the depth of the structural steel member that forms part of the prototype column.

The width-to-thickness ratios of compression elements of steel members of the test specimen shall meet the width-to-thickness limitations as specified in these Provisions for members in SMF, IMF, C-SMF, C-IMF, or EBF, as applicable.

Exception: The width-to-thickness ratios of compression elements of members in the test specimen are permitted to exceed the width-to-thickness limitations specified in these Provisions if both of the following conditions are met:

(a) The width-to-thickness ratios of compression elements of the members of the test specimen are no less than the width-to-
thickness ratios of compression elements in the corresponding prototype members.

(b) Design features that are intended to restrain local buckling in the test specimen such as concrete encasement of steel members, concrete filling of steel members and other similar features are representative of the corresponding design features in the prototype.

Extrapolation beyond the limitations stated in this section is permitted subject to qualified peer review and approval by the authority having jurisdiction.

**K2.3c. Reinforcing Steel Amount, Size and Detailing**

The total area of the longitudinal reinforcing bars shall not be less than 75% of the area in the prototype, and individual bars shall not have an area less than 70% of the maximum bar size in the prototype.

Design approaches and methods used for anchorage and development of reinforcement, and for splicing reinforcement in the test specimen shall be representative of the prototype.

The amount, arrangement and hook configurations for transverse reinforcement shall be representative of the bond, confinement and anchorage conditions of the prototype.

**K2.3d. Connection Details**

The connection details used in the test specimen shall represent the prototype connection details as closely as possible. The connection elements used in the test specimen shall be a full-scale representation of the connection elements used in the prototype, for the member sizes being tested.

**K2.3e. Continuity Plates**

The size and connection details of continuity plates used in the test specimen shall be proportioned to match the size and connection details of continuity plates used in the prototype connection as closely as possible.

**K2.3f. Steel Strength for Steel Members and Connection Elements**

The following additional requirements shall be satisfied for each steel
member or connection element of the test specimen that supplies inelastic rotation by yielding:

(a) The yield strength shall be determined as specified in Section K2.6a. The use of yield stress values that are reported on certified material test reports in lieu of physical testing is prohibited for the purposes of this section.

(b) The yield strength of the beam flange as tested in accordance with Section K2.6a shall not be more than 15% below $R_yF_y$ for the grade of steel to be used for the corresponding elements of the prototype.

(c) The yield strength of the columns and connection elements shall not be more than 15% above or below $R_yF_y$ for the grade of steel to be used for the corresponding elements of the prototype. $R_yF_y$ shall be determined in accordance with Section A3.2.

User Note: Based upon the above criteria, steel of the specified grade with a specified minimum yield stress, $F_y$, of up to and including 1.15 times the $R_yF_y$ for the steel tested should be permitted in the prototype. In production, this limit should be checked using the values stated on the steel manufacturer’s material test reports.

K2.3g. Steel Strength and Grade for Reinforcing Steel

Reinforcing steel in the test specimen shall have the same ASTM designation as the corresponding reinforcing steel in the prototype. The specified minimum yield stress of reinforcing steel in the test specimen shall not be less than the specified minimum yield stress of the corresponding reinforcing steel in the prototype.

K2.3h. Concrete Strength and Density

The specified compressive strength of concrete in members and connection elements of the test specimen shall be at least 75% and no more than 125% of the specified compressive strength of concrete in the corresponding members and connection elements of the prototype.

The compressive strength of concrete in the test specimen shall be determined in accordance with Section K2.6d.

The density classification of the concrete in the members and connection elements of the test specimen shall be the same as the density classification of concrete in the corresponding members and connection elements of the prototype. The density classification of concrete shall correspond to either normal weight, lightweight, all-lightweight, or sand-
lightweight as defined in ACI 318.

K2.3i. Welded Joints

Welds on the test specimen shall satisfy the following requirements:

(1) Welding shall be performed in conformance with Welding Procedure Specifications (WPS) as required in AWS D1.1/D1.1M. The WPS essential variables shall satisfy the requirements in AWS D1.1/D1.1M and shall be within the parameters established by the filler-metal manufacturer. The tensile strength and Charpy V-notch (CVN) toughness of the welds used in the test specimen shall be determined by tests as specified in Section K2.6e, made using the same filler metal classification, manufacturer, brand or trade name, diameter, and average heat input for the WPS used on the test specimen. The use of tensile strength and CVN toughness values that are reported on the manufacturer’s typical certificate of conformance in lieu of physical testing is prohibited for purposes of this section.

(2) The specified minimum tensile strength of the filler metal used for the test specimen shall be the same as that to be used for the welds on the corresponding prototype. The tensile strength of the deposited weld as tested in accordance with Section K2.6c shall not exceed the tensile strength classification of the filler metal specified for the prototype by more than 25 ksi (172 MPa).

User Note: Based upon the criteria in (2) above, should the tested tensile strength of the weld metal exceed 25 ksi (172 MPa) above the specified minimum tensile strength, the prototype weld should be made with a filler metal and WPS that will provide a tensile strength no less than 25 ksi (172 MPa) below the tensile strength measured in the material test plate. When this is the case, the tensile strength of welds resulting from use of the filler metal and the WPS to be used in the prototype should be determined by using an all-weld-metal tension specimen. The test plate is described in AWS D1.8/D1.8M clause A6 and shown in AWS D1.8/D1.8M Figure A.1.

(3) The specified minimum CVN toughness of the filler metal used for the test specimen shall not exceed that to be used for the welds on the corresponding prototype. The tested CVN toughness of the weld as tested in accordance with Section K2.6c shall not exceed the minimum CVN toughness specified for the prototype by more than 50%, nor 25 ft-lb (34 kJ), whichever is greater.

User Note: Based upon the criteria in (3) above, should the tested
CVN toughness of the weld metal in the material test specimen exceed the specified CVN toughness for the test specimen by 25 ft-lb (34 kJ) or 50%, whichever is greater, the prototype weld should be made with a filler metal and WPS that will provide a CVN toughness that is no less than 25 ft-lb (34 kJ) or 33% lower, whichever is lower, below the CVN toughness measured in the weld metal material test plate. When this is the case, the weld properties resulting from the filler metal and WPS to be used in the prototype should be determined using five CVN test specimens. The test plate is described in AWS D1.8/D1.8M clause A6 and shown in AWS D1.8/D1.8M Figure A.1.

(4) The welding positions used to make the welds on the test specimen shall be the same as those to be used for the prototype welds.

(5) Weld details such as backing, tabs and access holes used for the test specimen welds shall be the same as those to be used for the corresponding prototype welds. Weld backing and weld tabs shall not be removed from the test specimen welds unless the corresponding weld backing and weld tabs are removed from the prototype welds.

(6) Methods of inspection and nondestructive testing and standards of acceptance used for test specimen welds shall be the same as those to be used for the prototype welds.

User Note: The filler metal used for production of the prototype is permitted to be of a different classification, manufacturer, brand or trade name, and diameter, provided that Sections K2.3f(b) and K2.3f(c) are satisfied. To qualify alternate filler metals, the tests as prescribed in Section K2.6c should be conducted.

K2.3j.Bolted Joints

The bolted portions of the test specimen shall replicate the bolted portions of the prototype connection as closely as possible. Additionally, bolted portions of the test specimen shall satisfy the following requirements:

(1) The bolt grade (for example, ASTM A325, A325M, ASTM A490, A490M, ASTM F1852, ASTM F2280) used in the test specimen shall be the same as that to be used for the prototype, except that heavy hex bolts are permitted to be substituted for twist-off-type tension control bolts of equal minimum specified tensile strength, and vice versa.
(2) The type and orientation of bolt holes (standard, oversize, short slot, long slot or other) used in the test specimen shall be the same as those to be used for the corresponding bolt holes in the prototype.

(3) When inelastic rotation is to be developed either by yielding or by slip within a bolted portion of the connection, the method used to make the bolt holes (drilling, sub-punching and reaming, or other) in the test specimen shall be the same as that to be used in the corresponding bolt holes in the prototype.

(4) Bolts in the test specimen shall have the same installation (pretensioned or other) and faying surface preparation (no specified slip resistance, Class A or B slip resistance, or other) as that to be used for the corresponding bolts in the prototype.

K2.3k. Load Transfer Between Steel and Concrete

Methods used to provide load transfer between steel and concrete in the members and connection elements of the test specimen, including direct bearing, shear connection, friction and others, shall be representative of the prototype.

K2.4. Loading History

K2.4a. General Requirements

The test specimen shall be subjected to cyclic loads in accordance with the requirements prescribed in Section K2.4b for beam-to-column moment connections in SMF, IMF, C-SMF, and C-IMF, and in accordance with the requirements prescribed in Section K2.4c for link-to-column connections in EBF.

Loading sequences to qualify connections for use in SMF, IMF, C-SMF, or C-IMF with columns loaded orthogonally shall be applied about both axes using the loading sequence specified in Section K2.4b. Beams used about each axis shall represent the most demanding combination for which qualification or prequalification is sought. In lieu of concurrent application about each axis of the loading sequence specified in Section K2.4b, the loading sequence about one axis shall satisfy requirements of Section K2.4b while a concurrent load of constant magnitude, equal to the expected strength of the beam connected to the column about its orthogonal axis, shall be applied about the orthogonal axis.

Loading sequences other than those specified in Sections K2.4b and K2.4c are permitted to be used when they are demonstrated to be of equivalent or greater severity.
K2.4b. Loading Sequence for Beam-to-Column Moment Connections

Qualifying cyclic tests of beam-to-column moment connections in SMF, IMF, C-SMF and C-IMF shall be conducted by controlling the story drift angle, \( \theta \), imposed on the test specimen, as specified below:

1. 6 cycles at \( \theta = 0.00375 \text{ rad} \)
2. 6 cycles at \( \theta = 0.005 \text{ rad} \)
3. 6 cycles at \( \theta = 0.0075 \text{ rad} \)
4. 4 cycles at \( \theta = 0.01 \text{ rad} \)
5. 2 cycles at \( \theta = 0.015 \text{ rad} \)
6. 2 cycles at \( \theta = 0.02 \text{ rad} \)
7. 2 cycles at \( \theta = 0.03 \text{ rad} \)
8. 2 cycles at \( \theta = 0.04 \text{ rad} \)
9. Continue loading at increments of \( \theta = 0.01 \text{ rad} \), with two cycles of loading at each step.

K2.4c. Loading Sequence for Link-to-Column Connections

Qualifying cyclic tests of link-to-column moment connections in EBF shall be conducted by controlling the total link rotation angle, \( \gamma_{\text{total}} \), imposed on the test specimen, as follows:

1. 6 cycles at \( \gamma_{\text{total}} = 0.00375 \text{ rad} \)
2. 6 cycles at \( \gamma_{\text{total}} = 0.005 \text{ rad} \)
3. 6 cycles at \( \gamma_{\text{total}} = 0.0075 \text{ rad} \)
4. 6 cycles at \( \gamma_{\text{total}} = 0.01 \text{ rad} \)
5. 4 cycles at \( \gamma_{\text{total}} = 0.015 \text{ rad} \)
6. 4 cycles at \( \gamma_{\text{total}} = 0.02 \text{ rad} \)
7. 2 cycles at \( \gamma_{\text{total}} = 0.03 \text{ rad} \)
8. 1 cycle at \( \gamma_{\text{total}} = 0.04 \text{ rad} \)
9. 1 cycle at \( \gamma_{\text{total}} = 0.05 \text{ rad} \)
(10) 1 cycle at $\gamma_{total} = 0.07$ rad

(11) 1 cycle at $\gamma_{total} = 0.09$ rad

Continue loading at increments of $\gamma_{total} = 0.02$ rad, with one cycle of loading at each step.

K2.5. Instrumentation

Sufficient instrumentation shall be provided on the test specimen to permit measurement or calculation of the quantities listed in Section K2.7.

K2.6. Testing Requirements for Material Specimens

K2.6a. Tension Testing Requirements for Structural Steel Material Specimens

Tension testing shall be conducted on samples taken from material test plates in accordance with Section K2.6c. The material test plates shall be taken from the steel of the same heat as used in the test specimen. Tension-test results from certified material test reports shall be reported, but shall not be used in lieu of physical testing for the purposes of this section. Tension testing shall be conducted and reported for the following portions of the test specimen:

(a) Flange(s) and web(s) of beams and columns at standard locations

(b) Any element of the connection that supplies inelastic rotation by yielding

K2.6b. Tension Testing Requirements for Reinforcing Steel Material Specimens

Tension testing shall be conducted on samples of reinforcing steel in accordance with Section K2.6c. Samples of reinforcing steel used for material tests shall be taken from the same heat as used in the test specimen. Tension-test results from certified material test reports shall be reported, but shall not be used in lieu of physical testing for the purposes of this section.

K2.6c. Methods of Tension Testing for Structural and Reinforcing Steel Material Specimens

Tension testing shall be conducted in accordance with ASTM A6/A6M, ASTM A370, and ASTM E8, as applicable, with the following exceptions:
(a) The yield strength, $F_y$, that is reported from the test shall be based upon the yield strength definition in ASTM A370, using the offset method at 0.002 in./in. strain.

(b) The loading rate for the tension test shall replicate, as closely as practical, the loading rate to be used for the test specimen.

K2.6d. Testing Requirements for Concrete

Test cylinders of concrete used for the test specimen shall be made and cured in accordance with ASTM C31. At least three cylinders of each batch of concrete used in a component of the test specimen shall be tested within five days before or after of the end of the cyclic qualifying test of the test specimen. Tests of concrete cylinders shall be in accordance with ASTM C39. The average compressive strength of the three cylinders shall be no less than 90% and no greater than 150% of the specified compressive strength of the concrete in the corresponding member or connection element of the test specimen. In addition, the average compressive strength of the three cylinders shall be no more than 3000 psi greater than the specified compressive strength of the concrete in the corresponding member or connection element of the test specimen.

Exception: If the average compressive strength of three cylinders is outside of these limits, the specimen is still acceptable if supporting calculations or other evidence is provided to demonstrate how the difference in concrete strength will affect the connection performance.

K2.6e. Testing Requirements for Weld Metal Material Specimens

Weld metal testing shall be conducted on samples extracted from the material test plate, made using the same filler metal classification, manufacturer, brand or trade name and diameter, and using the same average heat input as used in the welding of the test specimen. The tensile strength and CVN toughness of weld material specimens shall be determined in accordance with Standard Methods for Mechanical Testing of Welds (AWS B4.0/B4.0M). The use of tensile strength and CVN toughness values that are reported on the manufacturer’s typical certificate of conformance in lieu of physical testing is prohibited for use for purposes of this section.

The same WPS shall be used to make the test specimen and the material test plate. The material test plate shall use base metal of the same grade and type as was used for the test specimen, although the same heat need not be used. If the average heat input used for making the material test plate is not within ±20% of that used for the test specimen, a new material test plate shall be made and tested.
K.7. Test Reporting Requirements

For each test specimen, a written test report meeting the requirements of the authority having jurisdiction and the requirements of this section shall be prepared. The report shall thoroughly document all key features and results of the test. The report shall include the following information:

(a) A drawing or clear description of the test subassemblage, including key dimensions, boundary conditions at loading and reaction points, and location of lateral braces.

(b) A drawing of the connection detail showing member sizes, grades of steel, the sizes of all connection elements, welding details including filler metal, the size and location of bolt holes, the size and grade of bolts, specified compressive strength and density of concrete, reinforcing bar sizes and grades, reinforcing bar locations, reinforcing bar splice and anchorage details, and all other pertinent details of the connection.

(c) A listing of all other essential variables for the test specimen, as listed in Section K2.3.

(d) A listing or plot showing the applied load or displacement history of the test specimen.

(e) A listing of all welds to be designated demand critical.

(f) Definition of the region of the member and connection to be designated a protected zone.

(g) A plot of the applied load versus the displacement of the test specimen. The displacement reported in this plot shall be measured at or near the point of load application. The locations on the test specimen where the loads and displacements were measured shall be clearly indicated.

(h) A plot of beam moment versus story drift angle for beam-to-column moment connections; or a plot of link shear force versus link rotation angle for link-to-column connections. For beam-to-column connections, the beam moment and the story drift angle shall be computed with respect to the centerline of the column.

(i) The story drift angle and the total inelastic rotation developed by the test specimen. The components of the test specimen contributing to the total inelastic rotation shall be identified. The portion of the total inelastic rotation contributed by each component of the test specimen shall be reported. The method used to compute inelastic rotations shall be clearly shown.
(j) A chronological listing of test observations, including observations of yielding, slip, instability, cracking and rupture of steel elements, cracking of concrete, and other damage of any portion of the test specimen as applicable.

(k) The controlling failure mode for the test specimen. If the test is terminated prior to failure, the reason for terminating the test shall be clearly indicated.

(l) The results of the material specimen tests specified in Section K2.6.

(m) The welding procedure specifications (WPS) and welding inspection reports.

Additional drawings, data, and discussion of the test specimen or test results are permitted to be included in the report.

**K2.8. Acceptance Criteria**

The test specimen must satisfy the strength and story drift angle or link rotation angle requirements of these Provisions for the SMF, IMF, C-SMF, C-IMF, or EBF connection, as applicable. The test specimen must sustain the required story drift angle or link rotation angle for at least one complete loading cycle.

**K3. CYCLIC TESTS FOR QUALIFICATION OF BUCKLING-RESTRAINED BRACES**

**K3.1. Scope**

This section includes requirements for qualifying cyclic tests of individual buckling-restrained braces and buckling-restrained brace subassemblages, when required in these provisions. The purpose of the testing of individual braces is to provide evidence that a buckling-restrained brace satisfies the requirements for strength and inelastic deformation by these provisions; it also permits the determination of maximum brace forces for design of adjoining elements. The purpose of testing of the brace subassemblage is to provide evidence that the brace design is able to satisfactorily accommodate the deformation and rotational demands associated with the design. Further, the subassemblage test is intended to demonstrate that the hysteretic behavior of the brace in the subassemblage is consistent with that of the individual brace elements tested uniaxially.

Alternative testing requirements are permitted when approved by the engineer of record and the authority having jurisdiction. This section provides only minimum recommendations for simplified test conditions.
K3.2. Subassemblage Test Specimen

The subassemblage test specimen shall satisfy the following requirements:

(a) The mechanism for accommodating inelastic rotation in the subassemblage test specimen brace shall be the same as that of the prototype. The rotational deformation demands on the subassemblage test specimen brace shall be equal to or greater than those of the prototype.

(b) The axial yield strength of the steel core, $P_{ysc}$, of the brace in the subassemblage test specimen shall not be less than 90% of that of the prototype where both strengths are based on the core area, $A_{sc}$, multiplied by the yield strength as determined from a coupon test.

(c) The cross-sectional shape and orientation of the steel core projection of the subassemblage test specimen brace shall be the same as that of the brace in the prototype.

(d) The same documented design methodology shall be used for design of the subassemblage as used for the prototype, to allow comparison of the rotational deformation demands on the subassemblage brace to the prototype. In stability calculations, beams, columns and gussets connecting the core shall be considered parts of this system.

(e) The calculated margins of safety for the prototype connection design, steel core projection stability, overall buckling and other relevant subassemblage test specimen brace construction details, excluding the gusset plate, for the prototype, shall equal or exceed those of the subassemblage test specimen construction.

(f) Lateral bracing of the subassemblage test specimen shall replicate the lateral bracing in the prototype.

(g) The brace test specimen and the prototype shall be manufactured in accordance with the same quality control and assurance processes and procedures.

Extrapolation beyond the limitations stated in this section is permitted subject to qualified peer review and approval by the authority having jurisdiction.

K3.3. Brace Test Specimen

The brace test specimen shall replicate as closely as is practical the pertinent design, detailing, construction features and material properties
K3.3a. Design of Brace Test Specimen

The same documented design methodology shall be used for the brace test specimen and the prototype. The design calculations shall demonstrate, at a minimum, the following requirements:

(a) The calculated margin of safety for stability against overall buckling for the prototype shall equal or exceed that of the brace test specimen.

(b) The calculated margins of safety for the brace test specimen and the prototype shall account for differences in material properties, including yield and ultimate stress, ultimate elongation, and toughness.

K3.3b. Manufacture of Brace Test Specimen

The brace test specimen and the prototype shall be manufactured in accordance with the same quality control and assurance processes and procedures.

K3.3c. Similarity of Brace Test Specimen and Prototype

The brace test specimen shall meet the following requirements:

(a) The cross-sectional shape and orientation of the steel core shall be the same as that of the prototype.

(b) The axial yield strength of the steel core, $P_{yfc}$ of the brace test specimen shall not be less than 30% nor more than 120% of the prototype where both strengths are based on the core area, $A_{sc}$, multiplied by the yield strength as determined from a coupon test.

(c) The material for, and method of, separation between the steel core and the buckling restraining mechanism in the brace test specimen shall be the same as that in the prototype.

Extrapolation beyond the limitations stated in this section is permitted subject to qualified peer review and approval by the authority having jurisdiction.

K3.3d. Connection Details

The connection details used in the brace test specimen shall represent the prototype connection details as closely as practical.

K3.3e. Materials
1. **Steel Core**

The following requirements shall be satisfied for the steel core of the brace test specimen:

(a) The specified minimum yield stress of the brace test specimen steel core shall be the same as that of the prototype.

(b) The measured yield stress of the material of the steel core in the brace test specimen shall be at least 90% of that of the prototype as determined from coupon tests.

(c) The specified minimum ultimate stress and strain of the brace test specimen steel core shall not exceed those of the prototype.

2. **Buckling-Restraining Mechanism**

Materials used in the buckling-restraining mechanism of the brace test specimen shall be the same as those used in the prototype.

**K3.3f. Connections**

The welded, bolted and pinned joints on the test specimen shall replicate those on the prototype as close as practical.

**K3.4. Loading History**

**K3.4a. General Requirements**

The test specimen shall be subjected to cyclic loads in accordance with the requirements prescribed in Sections K3.4b and K3.4c. Additional increments of loading beyond those described in Section K3.4c are permitted. Each cycle shall include a full tension and full compression excursion to the prescribed deformation.

**K3.4b. Test Control**

The test shall be conducted by controlling the level of axial or rotational deformation, $\Delta_\theta$, imposed on the test specimen. As an alternate, the maximum rotational deformation is permitted to be applied and maintained as the protocol is followed for axial deformation.

**K3.4c. Loading Sequence**

Loads shall be applied to the test specimen to produce the following deformations, where the deformation is the steel core axial deformation.
for the test specimen and the rotational deformation demand for the subassemblage test specimen brace:

(a) 2 cycles of loading at the deformation corresponding to $\Delta_b = \Delta_{by}$. 

(b) 2 cycles of loading at the deformation corresponding to $\Delta_b = 0.50 \Delta_{bm}$. 

(c) 2 cycles of loading at the deformation corresponding to $\Delta_b = 1.0 \Delta_{bm}$. 

(d) 2 cycles of loading at the deformation corresponding to $\Delta_b = 1.5 \Delta_{bm}$. 

(e) 2 cycles of loading at the deformation corresponding to $\Delta_b = 2.0 \Delta_{bm}$. 

(f) Additional complete cycles of loading at the deformation corresponding to $\Delta_b = 1.5 \Delta_{bm}$ as required for the brace test specimen to achieve a cumulative inelastic axial deformation of at least 200 times the yield deformation (not required for the subassemblage test specimen).

where

$\Delta_{bm}$ = value of deformation quantity, $\Delta_b$, at least equal to that corresponding to the design story drift, in. (mm)

$\Delta_{by}$ = value of deformation quantity, $\Delta_b$, at first yield of test specimen, in. (mm)

The design story drift shall not be taken as less than 0.01 times the story height for the purposes of calculating $\Delta_{bm}$. Other loading sequences are permitted to be used to qualify the test specimen when they are demonstrated to be of equal or greater severity in terms of maximum and cumulative inelastic deformation.

**K3.5. Instrumentation**

Sufficient instrumentation shall be provided on the test specimen to permit measurement or calculation of the quantities listed in Section K3.7.

**K3.6. Materials Testing Requirements**

**K3.6a. Tension Testing Requirements**

Tension testing shall be conducted on samples of steel taken from the same heat of steel as that used to manufacture the steel core. Tension test
results from certified material test reports shall be reported but are prohibited in place of material specimen testing for the purposes of this Section. Tension test results shall be based upon testing that is conducted in accordance with Section K3.6b.

K3.6b. Methods of Tension Testing

Tension testing shall be conducted in accordance with ASTM A6, ASTM A370 and ASTM E8, with the following exceptions:

(a) The yield stress that is reported from the test shall be based upon the yield strength definition in ASTM A370, using the offset method of 0.002 strain.

(b) The loading rate for the tension test shall replicate, as closely as is practical, the loading rate used for the test specimen.

(c) The coupon shall be machined so that its longitudinal axis is parallel to the longitudinal axis of the steel core.

K3.7. Test Reporting Requirements

For each test specimen, a written test report meeting the requirements of this Section shall be prepared. The report shall thoroughly document all key features and results of the test. The report shall include the following information:

(a) A drawing or clear description of the test specimen, including key dimensions, boundary conditions at loading and reaction points, and location of lateral bracing, if any.

(b) A drawing of the connection details showing member sizes, grades of steel, the sizes of all connection elements, welding details including filler metal, the size and location of bolt or pin holes, the size and grade of connectors, and all other pertinent details of the connections.

(c) A listing of all other essential variables as listed in Sections K3.2 or K3.3.

(d) A listing or plot showing the applied load or displacement history.

(e) A plot of the applied load versus the deformation, \( \Delta \). The method used to determine the deformations shall be clearly shown. The locations on the test specimen where the loads and deformations were measured shall be clearly identified.

(f) A chronological listing of test observations, including observations of yielding, slip, instability, transverse displacement
along the test specimen and rupture of any portion of the test specimen and connections, as applicable.

(g) The results of the material specimen tests specified in Section K3.6.

(h) The manufacturing quality control and quality assurance plans used for the fabrication of the test specimen. These shall be included with the welding procedure specifications and welding inspection reports.

Additional drawings, data and discussion of the test specimen or test results are permitted to be included in the report.

K3.8. Acceptance Criteria

At least one subassemblage test that satisfies the requirements of Section K3.2 shall be performed. At least one brace test that satisfies the requirements of Section K3.3 shall be performed. Within the required protocol range all tests shall satisfy the following requirements:

(a) The plot showing the applied load vs. displacement history shall exhibit stable, repeatable behavior with positive incremental stiffness.

(b) There shall be no rupture, brace instability, or brace end connection failure.

(c) For brace tests, each cycle to a deformation greater than $\Delta_{by}$ the maximum tension and compression forces shall not be less than the nominal strength of the core.

(d) For brace tests, each cycle to a deformation greater than $\Delta_{by}$ the ratio of the maximum compression force to the maximum tension force shall not exceed 1.5.

Other acceptance criteria are permitted to be adopted for the brace test specimen or subassemblage test specimen subject to qualified peer review and approval by the authority having jurisdiction.
